

BEFORE THE ILLINOIS ENVIRONMENTAL PROTECTION AGENCY

IN THE MATTER OF: )  
)  
Proposed State Implementation Plan )  
("SIP") Revision for the Maintenance ) IEPA File #27-96  
Plan for the Granite City PM-10 )  
Nonattainment Area. )

Hearing conducted at the Harold Brown  
Recreation Center, Amos & Franklin, Granite City,  
Illinois, on May 6, 1996.

AGENCY HEARING OFFICER: JOHN D. WILLIAMS  
2200 Churchill Road  
P. O. Box 19276  
Springfield, Illinois 62794-9276

REPORTER: Kimberly Mueller, CSR #084-002718

APPEARANCES:

Rachel L. Doctors, Assistant Counsel  
Division of Legal Counsel  
Robert Kaleel, Manager, Air Quality Modeling Unit  
Robert Swinford, Supervisor, Data Management Sub-Unit  
Air Monitoring Section, Bureau of Air  
Berkley L. Moore, P.E., Environmental Protection Engineer  
Air Quality Planning Section  
Jeffrey J. Benbenek, Field Operations, Collinsville  
Bureau of Air  
John Justice, Field Operations, Collinsville  
Bureau of Air  
Jim Henry, Ambient Air Monitoring, Collinsville  
Brad Frost, Community Relations Officer, Bureau of Air

1 HEARING OFFICER WILLIAMS: Let the record  
2 show that this is a public hearing before the Illinois  
3 Environmental Protection Agency in the matter of  
4 Proposed State Implementation Plan, SIP, Revision for  
5 the Maintenance Plan for the Granite City PM-10  
6 Nonattainment Area. It's IEPA File Number 27-96. Good  
7 morning, ladies and gentlemen. Welcome to this  
8 hearing. My name is John Williams and I'm the Hearing  
9 Officer for these proceedings. I will introduce the  
10 other members of the Illinois Environmental Protection  
11 Agency, Illinois EPA, Bureau of Air, BOA, Division of  
12 Air Pollution Control staff when they make their  
13 presentations. This hearing is being held by the  
14 Illinois EPA's Bureau of Air, Division of Air Pollution  
15 Control for the purpose of providing an opportunity for  
16 the public to understand and comment on the Illinois  
17 EPA's proposed State Implementation Plan, SIP, Revision  
18 for the Maintenance Plan for the Granite City PM-10  
19 Nonattainment Area. The hearing will be conducted under  
20 the provisions of the Agency's Procedures for  
21 Informational and Quasi-Legislative Public Hearings, 35  
22 Illinois Administrative Code Part 164. Copies of these  
23 procedures can be obtained from me upon request. Any  
24 person who wishes to make oral comments, that is,  
25 testify, may do so as long as the statements are

1 relevant to the issues which are to be addressed at the  
2 hearing. If you have lengthy comments to make, please  
3 submit them to me in writing before the close of the  
4 comment period and I will ensure that they are included  
5 in the hearing record as exhibits. There are comment  
6 forms at the registration table for your convenience if  
7 you wish to use these. Otherwise, comments written on  
8 standard eight and a half by eleven inch paper will be  
9 acceptable. If you have long and lengthy comments, you  
10 might want to write your name on the front of the  
11 comment form and then attach the comment form to your  
12 comments. You may ask questions of anyone who has made  
13 oral comments provided that inquiry is firstly framed as  
14 a question; second, relevant to the comments; and third,  
15 not repetitious. Arguing or dialogue with any speaker  
16 or witness instead of questions will not be allowed.  
17 Questions will be directed to me, the Hearing Officer,  
18 and I will then direct the witness to respond as  
19 necessary. Testimony will be limited to ten minutes  
20 until everyone has had an opportunity to comment, after  
21 which the witnesses will be allowed to speak again.  
22 Persons making comments or asking questions will first  
23 please state their name and, if applicable, any  
24 organization that they represent for the hearing  
25 record. For instance, if you wish to just state your

1 name John Smith, Sierra Club, that's fine. You don't  
2 have to say John Smith, Sierra Club every time, just  
3 your first name. The Agency will listen to all relevant  
4 testimony and will let all relevant documents or data as  
5 exhibits into the hearing record. Once the hearing is  
6 adjourned today, I will hold the hearing record open  
7 until May the 13th, 1996. During this time, all  
8 relevant written comments, documents or data will be  
9 accepted and entered into the hearing record as  
10 exhibits. Please send all written comments, documents  
11 or data to my attention as follows. John D. Williams,  
12 Hearing Officer, Illinois EPA, 2200 Churchill Road, P. O.  
13 Box 19276, Springfield, Illinois, 62794-9276. Written  
14 comments need not be notarized as to the facts asserted  
15 and should be postmarked on or before midnight, May the  
16 13th, 1996. Copies of the hearing agenda, comment forms  
17 and other information are available at the registration  
18 area for your convenience. If you have not yet  
19 registered at the registration area, please do so now.  
20 Anyone who fills out a registration card will receive a  
21 copy of the Responsiveness Summary, the Agency's  
22 response to public comments, when this document is  
23 published. Please check the box on the registration  
24 card if you wish to make oral comments. If you wish to  
25 make comments but have a time constraint, please let the

1 Agency staff at the registration table know and I will  
2 endeavor to call on you early. You require any further  
3 information after this hearing is over, please contact  
4 me at telephone number area code (217) 782-5544 or  
5 Miss Rachel Doctors at area code (217) 524-3333 and we  
6 will be glad to help you. On behalf of Director Mary A.  
7 Gade, the Illinois EPA's Bureau of Air, Division of Air  
8 Pollution Control staff and myself, I wish to thank you  
9 all for attending today and your participation at this  
10 hearing. Some people came in after I had started my  
11 statement. Will those people -- if you wish to comment  
12 or make comments, would you please fill in one of these  
13 registration cards. It's not mandatory, but if you wish  
14 to testify or comment, we would appreciate it. Also,  
15 you'll get a copy of the Responsiveness Summary, will be  
16 put on the mailing list for that. Also, there are  
17 agenda forms here and other materials here. At this  
18 time I'd like to introduce the Agency staff present.  
19 First of all, my name's John Williams. I'm with the  
20 Division of Legal Counsel. I'm Hearing Officer and I  
21 work for Division of Legal Counsel for the Director's  
22 office. We have today Mr. Rob Kaleel, Manager Modeling  
23 Unit, Bureau of Air. Mr. Kaleel. Next to me is  
24 Miss Rachel Doctors. She's Counsel, Division of Legal  
25 Counsel and she works for Bureau of Air. She represents

1 Bureau of Air. We have Mr. Bob Swinford. He's Ambient  
2 Air Monitoring, Bureau of Air. Mr. Swinford. We have  
3 Mr. Berkley Moore. He's Engineer, Planning Section of  
4 Bureau of Air. We have Mr. Jeff Benbenek, Field  
5 Operations, Collinsville, Bureau of Air. John Justice.  
6 John for -- he's Field Operations, Collinsville, Bureau  
7 of Air. Getting a little tongue-tied there. Jim Henry,  
8 Ambient Air Monitoring, Collinsville. Jim. Okay. And  
9 Mr. Brad Frost who's our Community Relations Officer.  
10 He works for the Bureau of Air. He also works for the  
11 Director's office and if you have any questions or need  
12 any documents or anything like that after the hearing is  
13 over, please talk to Mr. Frost and he will take your  
14 name and address or endeavor to get those documents for  
15 you. At this time I'm going to turn this matter over to  
16 Miss Rachel Doctors who will introduce the -- who will  
17 introduce the speakers in sequence. Who's the first  
18 speaker?

19 MS. DOCTORS: Mr. Kaleel will make --

20 HEARING OFFICER WILLIAMS: Okay, Mr. Rob  
21 Kaleel. Mr. Kaleel, go ahead.

22 MR. KALEEL: Hi, my name is Robert  
23 Kaleel. I'm the Manager of the Air Quality Modeling  
24 Unit in the Division of Air Pollution Control for the  
25 Illinois Environmental Protection Agency. The purpose

1 of today's hearing is to discuss the State's proposed  
2 maintenance plan for the Granite City area. This area  
3 was designated by the United States Environmental  
4 Protection Agency, or USEPA, as nonattainment for  
5 particulate matter, PM-10, for the National Ambient Air  
6 Quality Standards, NAAQS. The area is now meeting the  
7 NAAQS for PM-10. The maintenance plan will ensure that  
8 the PM-10 concentrations in the area will continue to  
9 meet the NAAQS in the future. Particulate matter is any  
10 solid or liquid material other than water which exists  
11 in a finely divided form. USEPA has determined that  
12 while larger particles in the atmosphere can cause  
13 nuisances, it is particulate matter in the PM-10 size  
14 range, that is, those particles ten micrometers or less  
15 in aerodynamic diameter, that threaten human health and  
16 welfare. USEPA and the State of Illinois have  
17 promulgated air quality standards for PM-10. There is  
18 an annual average standard of fifty micrograms per cubic  
19 meter and a twenty-four hour standard of one hundred and  
20 fifty micrograms per cubic meter, not to be exceeded  
21 more than an average of once per year over a three-year  
22 period. These standards are designed to protect the  
23 health of even the most susceptible individuals, that  
24 is, the very young, the very elderly and those with  
25 respiratory diseases. The national standards are set

1 based on scientific research and human health studies.  
2 They include a certain margin of safety and are reviewed  
3 periodically by USEPA. Granite City PM-10 nonattainment  
4 area was formally designated on November 15th, 1990, by  
5 operation of law as not in attainment of the National  
6 Ambient Air Quality Standards for PM-10. The  
7 designation was made because the Federal Clean Air Act  
8 as amended on that date required all areas classified as  
9 Group I in the August 7th, 1987, Federal Register to be  
10 so designated upon enactment of that act. On April 9th,  
11 1992, the Illinois Pollution Control Board promulgated a  
12 set of PM-10 emission limitations and control  
13 requirements for sources in the Granite City area.  
14 These regulations added additional particulate matter  
15 requirements to those that were already in place for  
16 industry in Illinois. New regulations which reflected  
17 rules that were stricter than the existing Board  
18 particulate matter regulations, which also continue to  
19 apply, included new emission limits that applied to all  
20 process source stack emissions, tighter regulations for  
21 dust and other specific rule revisions for a number of  
22 sources. The area is now meeting the NAAQS for PM-10.  
23 Neither the annual nor the twenty-four hour standards  
24 have been exceeded during the past three years in the  
25 area for which the maintenance plan has been prepared.

1 A major contributor to the improvement in PM-10 air  
2 quality has been the tightening of the regulations that  
3 I referenced earlier. These rules required additional  
4 dust control from storage piles, material handling,  
5 paved and unpaved roadways and paving of many roadways  
6 that were formerly unpaved. The maintenance plan  
7 proposed by IEPA includes several provisions. First,  
8 the regulations that were tightened to achieve  
9 attainment of the PM-10 standards will continue to apply  
10 to the industries in the area. This maintenance plan  
11 does not relax or loosen the emission limitations that  
12 are now in place and these limits will not be relaxed  
13 when the area is redesignated to attainment. Second,  
14 the Agency will take immediate investigative action  
15 should air quality ever reach the level of the  
16 standard. In the investigation the Agency will identify  
17 the source or sources responsible for the exceedance and  
18 then initiate follow-up action. Such further action  
19 might consist of requiring stack tests if equipment  
20 seems to be operating improperly, taking enforcement  
21 action if such continued operating persists or proposing  
22 new PM-10 emission limitations to the Pollution Control  
23 Board if that were needed. Third, the Agency will  
24 continue to inspect sources and enforce the state air  
25 pollution control rules, regulations and emission

1 limitations that are in effect in this area and,  
2 finally, PM-10 monitoring equipment will remain in place  
3 and air quality will continue to be carefully watched.  
4 The maintenance plan is consistent with the provisions  
5 of the Clean Air Act and this plan will ensure that the  
6 area will continue to meet the National Ambient Air  
7 Quality Standards for PM-10 in the future. Mr. Bob  
8 Swinford of the Air Monitoring Section will now provide  
9 a more detailed discussion of the air quality data for  
10 this area.

11 HEARING OFFICER WILLIAMS: Mr. Swinford.

12 MR. SWINFORD: Okay, my name is Robert  
13 Swinford. I am currently the supervisor of the Data  
14 Management Sub-unit in the Air Monitoring Section,  
15 Bureau of Air, for the Environmental -- Illinois  
16 Environmental Protection Agency. The purpose of my  
17 testimony today is to present a summary of PM-10 ambient  
18 air monitoring data collected in the Granite City  
19 nonattainment area. First slide. The first overhead is  
20 a map of the Granite City nonattainment area showing the  
21 locations of our existing PM-10 monitoring sites. For  
22 reference, the green border is the boundary of the PM-10  
23 nonattainment area.

24 HEARING OFFICER WILLIAMS: Excuse me.  
25 Can everybody see that correctly? Okay, go ahead. Go

1 ahead.

2 MR. SWINFORD: There are four PM-10  
3 monitoring sites in Granite City. Three National Air  
4 Monitoring Sites located at 15th and Madison, 23rd and  
5 Madison and 2044 Washington, those are sites that are  
6 known as NAMS and one State and Local Air Monitoring  
7 Site located at 2420 Nameoki which is also known as  
8 SLAMS. Sampling at 2044 Washington is conducted on an  
9 everyday schedule and the other three sites are operated  
10 on an every six day schedule. The most recent air  
11 quality data, 1993 through 1995, shows that the Granite  
12 City area is achieving compliance with both the annual  
13 and twenty-four hour air quality standards. This result  
14 is depicted in the following figures. First figure is  
15 the chart of annual arithmetic means. The first chart  
16 shows that the highest annual average of all sites in  
17 the area is below the annual standard of fifty  
18 micrograms per cubic meter in all three years, 1993  
19 through 1995. During this period of time, the highest  
20 mean was 46 micrograms per cubic meter. Thus, the  
21 annual standard is being achieved. The second figure  
22 shows a chart of the highest twenty-four hour values.  
23 In this particular case, it's the highest second high in  
24 the area during each year. The second high value is  
25 important because since we are allowed three exceedances

1 during any three-year period, then if all second high  
2 values are below the level of the standard, we have  
3 achieved compliance. And in this case all three second  
4 high values for all three years are well below the level  
5 of the standard which is a hundred and fifty micrograms  
6 per cubic meter for a twenty-four hour average and thus  
7 the twenty-four hour standard is also being achieved.  
8 Ambient air monitoring for PM-10 will continue in the  
9 Granite City area in the future to verify that air  
10 quality levels remain in compliance with the air quality  
11 standards. Thank you.

12 HEARING OFFICER WILLIAMS: All right.  
13 That concludes the presentations by the Air Pollution  
14 Control staff. At this time I'm going to open it up to  
15 questions. Now this is questions for the speakers.  
16 You'll have an opportunity to comment later on, but  
17 these are -- these are questions for the speakers as to  
18 what they have just told you. Any questions? Yes,  
19 ma'am. Could you state your name and any organization  
20 that you represent, please?

21 MS. ANDRIA: Yes, Kathy Andria. Kathy  
22 with a K, A-N-D-R-I-A. I represent SPILL, Stop  
23 Polluting Illinois, and I'm with the Madison County  
24 Conservation Alliance.

25 HEARING OFFICER WILLIAMS: Okay.

1 MS. ANDRIA: I wanted to -- my first  
2 question is why are you changing the status?

3 MR. KALEEL: We are changing the status  
4 -- the attainment designation itself is an  
5 administrative tool that is used to indicate areas where  
6 further planning, further regulatory development is  
7 needed. The Clean Air Act compels us to move areas that  
8 have been designated nonattainment to attainment at a  
9 specified time frame and in this case the attainment  
10 date for this area was 1994. We've achieved that  
11 target. Further planning requirements are not needed  
12 for this area at this time and that is the reason why  
13 we're moving ahead with it. We've achieved the target  
14 and it's time to change the designation.

15 MS. ANDRIA: Has any reporting for 1996  
16 changed the status? Have there been violations reported  
17 in 1996?

18 MR. KALEEL: I guess I would refer that  
19 question to Bob Swinford of the Monitoring Section.

20 MR. SWINFORD: As far as on a twenty-four  
21 hour basis, we have not had any values over one fifty  
22 thus far in 1996. Of course the annual basis we won't  
23 know until the end of the year, but it doesn't appear  
24 that that at this point is a problem.

25 MS. ANDRIA: What happens if you don't

1 change the status now? If you don't make it  
2 nonattainment now?

3 MR. KALEEL: There aren't --

4 MS. ANDRIA: -- I mean if you don't make  
5 it attainment now.

6 MR. KALEEL: Well, there aren't any  
7 specific penalties if that's what you're referring to if  
8 we don't redesignate. If we were not to achieve  
9 attainment, then there are sanctions and other penalties  
10 that are provided by the Clean Air Act. Since we have  
11 reached attainment, those sanctions will not apply and  
12 those penalties will not apply.

13 MS. ANDRIA: How does it affect the area  
14 to be attainment? What -- how does it affect the  
15 industries that are already here and how does it affect  
16 industries that are yet to come?

17 MR. KALEEL: There are some requirements  
18 or some changes in the requirements for permitting that  
19 would be affected by the attainment designation. It's  
20 not at all clear that the differences in the program for  
21 attainment areas versus nonattainment areas is looser or  
22 tighter, but it is a different program. The program  
23 that is used to permit new sources or modifications to  
24 existing sources under a nonattainment area designation  
25 is called the New Source Review Program. For attainment

1 areas the program is called Prevention of Significant  
2 Deterioration or PSD. In other words, they're -- it's  
3 just different requirements that new sources would have  
4 to demonstrate.

5 MS. ANDRIA: So that new sources then  
6 would not -- if this is achieved, if attainment is  
7 achieved, new source would not have to produce offsets  
8 and have credits or whatever?

9 MR. KALEEL: That's right. That's one of  
10 the features of the New Source Review Program is the  
11 offset requirement and that is not applicable in the  
12 case of PSD.

13 MS. ANDRIA: Does this application -- I  
14 mean the timing of this now have anything to do with  
15 proposed Conagra plant that is -- that the local people  
16 are trying to bring in?

17 MR. KALEEL: Has no linkage to any  
18 specific permits in the area or any proposed permits.

19 MS. ANDRIA: Has -- who has requested --  
20 has anyone requested that this change take place now?

21 MR. KALEEL: No. This is strictly an  
22 Agency initiative.

23 MS. ANDRIA: Is -- have you -- how have  
24 you taken into effect the fact that you've granted a  
25 variance recently to Spectrulite which would affect

1 particulate and the expansion of Granite City Steel?

2 MS. DOCTORS: The variance is actually --  
3 it's part of the rule, the recent rule, so that's going  
4 to be submitted. The rule -- the variance was prior to  
5 the new rule we did, R 96.5 and it's included in the  
6 rule and the Granite City expansion is also taken into  
7 account in the rule and they actually requested some  
8 different limits, so there -- it is totally accounted  
9 for prior to this change.

10 MS. ANDRIA: It's accounted for in the  
11 rule. How is it accounted for in the data that you've  
12 used to state that it's going to remain in compliance  
13 and attainment?

14 MR. KALEEL: Part of our requirement in  
15 terms of being able to demonstrate attainment to USEPA  
16 is to perform not just the ambient air monitoring that  
17 we discussed, but also detailed air quality modeling  
18 assessment, and we have performed that assessment prior  
19 to going to the Pollution Control Board in 1991 when we  
20 developed our original plan for the area and we have  
21 verified continued attainment using the same modeling  
22 techniques for the projects that you referenced, so  
23 those were accounted for in our attainment plan.

24 MS. ANDRIA: You mentioned, I think, that  
25 PM-10 is -- this was designed, the things that threaten

1 human health and welfare and designed to protect the  
2 health of even the most vulnerable of the people. How  
3 have you -- have you done any research about the local  
4 population, anything that shows that in addition to your  
5 material that says that PM-10 has subsided, that the  
6 health effects that are caused by PM-10 have also  
7 subsided?

8 MR. KALEEL: We have not done any  
9 specific health studies of that nature.

10 HEARING OFFICER WILLIAMS: Miss Andria,  
11 you've been asking a lot of questions.

12 MS. ANDRIA: Okay.

13 HEARING OFFICER WILLIAMS: And have you  
14 got more questions here because I'm going to allow --

15 MS. ANDRIA: -- I'll finish at the end.  
16 That's okay. Let's go to someone else.

17 HEARING OFFICER WILLIAMS: Okay, we'll  
18 see if somebody else has questions now. Does anybody  
19 else got questions for these speakers? Yes, sir, could  
20 you state your name and who you represent for the  
21 record, please?

22 MR. BIENIECKI: My name is Henry  
23 Bieniecki, B-I-E-N-I-E-C-K-I. I represent the Piasa  
24 Palisade Group of the Illinois Sierra Club.

25 HEARING OFFICER WILLIAMS: Go ahead,

1 sir.

2 MR. BIENIECKI: I would like to ask how  
3 many square miles are in this nonattainment area?

4 MR. KALEEL: I don't recall  
5 specifically. I think the map that we showed a moment  
6 ago shows the outlines of the nonattainment area. It  
7 includes all of the city of Granite City and the  
8 township, Nameoki Township, but I don't know exactly how  
9 many square miles we're talking about. Maybe we could  
10 put that --

11 MR. BIENIECKI: -- Looked kind of small  
12 to me.

13 MR. KALEEL: Okay, the nonattainment area  
14 is the area bordered in green there on that map.

15 MR. BIENIECKI: I would say that is  
16 Granite City Township only. It does not include --

17 MS. ANDRIA: -- It includes part of  
18 Nameoki Township.

19 MR. BIENIECKI: Hmm?

20 MS. ANDRIA: It includes part of Nameoki  
21 Township.

22 MR. BIENIECKI: The southern part?

23 MS. ANDRIA: Right there along Horseshoe  
24 Lake and that's --

25 MR. KALEEL: -- The formal designation of

1 the nonattainment area is also all of Nameoki Township,  
2 so if there is some inaccuracies in the map, that wasn't  
3 intended.

4 MR. BIENIECKI: It includes all of  
5 Nameoki Township?

6 MR. KALEEL: Yes, including the city of  
7 Granite City.

8 MR. BIENIECKI: Nameoki Township also all  
9 of Venice and Madison?

10 MS. ANDRIA: That's Venice Township.

11 MR. BIENIECKI: Huh?

12 MS. ANDRIA: That's Venice Township.

13 MR. BIENIECKI: Okay, sorry. I'm  
14 confused. Okay, how is this boundary set, I'd like to  
15 ask? How do you establish the boundary for this  
16 nonattainment area?

17 MR. KALEEL: The boundary was set trying  
18 to use commonly available or commonly understood  
19 political boundaries. It was originally intended to  
20 encompass the study area that we defined for PM-10 which  
21 looked at the major industrial portions of Granite  
22 City.

23 MR. BIENIECKI: I was once chairman, I  
24 guess for about ten years, of the Granite City -- the  
25 now defunct Granite City Air Pollution Control Board.

1 As I recall, most of our problems in Granite City with  
2 respect to particulates centered around one monitoring  
3 station that was at 20th and Omaha. I don't recall,  
4 perhaps Jim Henry may know whether that was a state  
5 station or the city station. I think it started out as  
6 a city station set up by a consulting engineer that the  
7 city hired at that time and it was maintained from then  
8 forward and apparently disappeared in recent years. The  
9 house that it was mounted on, apparently the property  
10 was bought by Granite City Steel and the house has been  
11 removed as have most of those in that neighborhood and I  
12 understood that a monitoring station would be  
13 established there last time I was in conversation with  
14 someone, but I see now that there is a new station at 20  
15 -- roughly 21st and Washington. I'm not sure what that  
16 -- if that 2044 address -- I'm not sure how far east  
17 that goes on Washington, but my question is that this  
18 represents, to me as an engineer, some sort of  
19 discontinuity in your data from one period to another.  
20 Has there been some accounting for that discontinuity?

21 MR. KALEEL: What we try to do is  
22 obviously put the monitoring -- monitoring equipment at  
23 the locations of population exposure and also areas  
24 where we expect to record the highest levels in  
25 particulate matter in the area. Of course we're subject

1 to property owners giving us permission to locate  
2 equipment there, so we have some limitations in that  
3 area, but I would point out that the purpose -- one of  
4 the purposes of doing the modeling, the air quality  
5 modeling analyses that I described before is to try to  
6 fill in the gaps in the monitoring network, be able to  
7 look at projected air quality, what types of  
8 concentrations would occur in places where we can't  
9 locate monitors and in that process of doing the  
10 modeling, we've shown that air quality, the air quality  
11 standards are protected everywhere in Granite City, not  
12 just at the locations of the monitors.

13 MR. BIENIECKI: Well, my recollection is  
14 that the station at 20th and Omaha was frequently two  
15 and three times the next highest station. There was  
16 always a top station in the whole state of Illinois.  
17 Does your air monitoring -- or does your modeling  
18 reflect that same relationship with that site?

19 MR. KALEEL: Yes, it does. We try to  
20 project air quality concentrations using the dispersion  
21 modeling techniques for locations on the public right of  
22 way, the roadways at 20th Street that runs adjacent to  
23 the Granite City Steel complex and I think is where this  
24 previous monitor was located. We did project air  
25 quality concentrations using the model. We did our best

1 to verify that the model was projecting accurate  
2 concentrations and in developing our attainment plan, we  
3 projected air quality concentrations that are consistent  
4 with our emission limitations in the regulations and we  
5 projected that the air quality standards would be  
6 protected even at that location.

7 MR. BIENIECKI: Do you get with a model  
8 -- do you get those same levels that existed during  
9 that period when that monitoring station existed?

10 MR. KALEEL: The modeling process is --  
11 there's multiple phases. One of the first things we  
12 tried to do with the model was to verify that we could  
13 reproduce concentrations of that magnitude in that area,  
14 in other words, to make sure that the model was  
15 realistic and using the emission rates as we understood  
16 them at that time back in the early 1990's when we  
17 started this process, we had very good agreement between  
18 the model -- model result and the monitors in the area;  
19 however, when we test the model in terms of emissions  
20 that are consistent with the new regulations and, as I  
21 mentioned, new regulations are somewhat stricter than  
22 they existed prior to 1991, that the model projected  
23 attainment and we've seen attainment since the time that  
24 those regulations have been complied with by the  
25 industries in the area.

1                   HEARING OFFICER WILLIAMS: I'm going to  
2 allow you one more question and then we'll see if some  
3 other people -- and we'll allow you, you know, later on  
4 you can ask more questions. You got any other  
5 questions, sir?

6                   MR. BIENIECKI: Well, I'm not sure that  
7 you made it clear to me that you do -- your modeling  
8 does show that the station -- if the station at 20th and  
9 Omaha existed today, that it would show the same very  
10 high levels of particulates that it once did in relation  
11 to the other stations.

12                  MR. KALEEL: I'm quite confident that  
13 they wouldn't show values as high as they were prior to  
14 1991 based on the fact that significant new regulations  
15 were imposed on the industries in the area beginning in  
16 1992 and at about the same time we've noticed that the  
17 air quality concentrations in the area have come down  
18 significantly and, in fact, are in attainment.

19                  HEARING OFFICER WILLIAMS: Okay. Are  
20 there any more questions from members of the public?  
21 Yes, Miss Livingston.

22                  MS. LIVINGSTON: You ready for me, John?

23                  HEARING OFFICER WILLIAMS: Yeah, go  
24 ahead.

25                  MS. LIVINGSTON: I'm Penny Livingston.

1 With respect to --

2 HEARING OFFICER WILLIAMS: -- What is  
3 your office at the present moment?

4 MS. LIVINGSTON: I'm with the St. Clair  
5 County State's Attorney's office.

6 HEARING OFFICER WILLIAMS: Okay.

7 MS. LIVINGSTON: I do all of their  
8 environmental prosecution. With respect to the modeling  
9 that you're discussing, did you base the findings in  
10 your model on allowables or actual emissions?

11 MR. KALEEL: The attainment plan that I  
12 discussed where we actually tried to project what the  
13 emission rates would be from each source in the area,  
14 were they to comply with our new regulations, they would  
15 represent allowables and generally allowable emissions  
16 are higher or overstate what any particular company is  
17 doing at any particular time. Obviously if a company is  
18 complying with a particular emission limit, they cannot  
19 exceed that emission limit and most companies choose to  
20 overcomply so that they don't run into a situation where  
21 they exceed the limit and are subject to enforcement by  
22 the Agency.

23 MS. LIVINGSTON: Based on your pretty  
24 high level of experience, does it make you nervous that  
25 the actual emissions are twenty-two percent of the

1 allowables and you're having the current readings that  
2 you are that don't exceed the standards? You feel  
3 comfortable with it?

4 MR. KALEEL: I'm not sure that I'm  
5 following the basis of that.

6 MS. LIVINGSTON: Well, right now we know  
7 what the readings are and they don't exceed the  
8 twenty-four hour standards and they don't exceed the  
9 annual standards, although they come up above forty,  
10 towards the fifty mark, and they come up above hundred  
11 and ten towards the one fifty mark, but they don't --  
12 they don't exceed obviously based on the data. Does it  
13 -- are you comfortable with the fact that while it's  
14 not exceeding now, the allowables are significantly  
15 higher than the actuals? In your report it says actuals  
16 are twenty-two percent of the allowable emissions.

17 MR. KALEEL: I'm comfortable with the  
18 findings there. We have, in fact, projected what the  
19 air quality would be if sources in the area were  
20 emitting at their allowable, not their actuals, and  
21 we've verified that is still consistent with attainment  
22 of the standards.

23 MS. LIVINGSTON: So at their allowables  
24 which would be thousands of tons more, you think the  
25 standards would still be met?

1 MR. KALEEL: Yes.

2 MS. LIVINGSTON: Okay.

3 MR. KALEEL: I would point out there was  
4 an inaccuracy in terms of the specific number that is  
5 mentioned in the maintenance plan for the allowable.  
6 The allowables in the area are not nearly as high as  
7 they are shown in that document. We apologize for  
8 that. We will correct that.

9 MS. LIVINGSTON: So the actuals really  
10 are higher than twenty-two percent of the allowables?  
11 It would be more like thirty --

12 MR. KALEEL: -- The actuals that are  
13 listed in that document are, I think, our best estimate,  
14 but we think that the allowables that are listed in that  
15 document are too high.

16 MS. LIVINGSTON: Would be much lower?

17 MR. KALEEL: The allowables would be much  
18 lower.

19 MS. LIVINGSTON: That's good.

20 MR. KALEEL: The argument is still the  
21 same. The allowables are higher, significantly higher  
22 than the actuals in the area and by modeling allowables,  
23 we've projected concentrations that in fact are  
24 conservatively high, but the allowable in the area would  
25 not in actuality be as high as what we projected with

1 the model.

2 MS. LIVINGSTON: Does your fugitive dust  
3 plan require record keeping of what the facilities are  
4 doing to control their dust?

5 MR. KALEEL: Yes, it does.

6 MS. LIVINGSTON: That's good. I had a  
7 couple questions for you, Bob. You made a statement  
8 that we're allowed three exceedances in a three-year  
9 period. Did you mean to say that if we had three  
10 exceedances, that would kick us into nonattainment?

11 MR. SWINFORD: No, we would have to have  
12 more than three exceedances at any given site in a  
13 three-year period to go into nonattainment situation, so  
14 we are allowed three at each site during a three-year  
15 period.

16 MS. LIVINGSTON: So if you had three this  
17 year, would you consider that to be more than one in a  
18 one-year period and it would kick it into  
19 nonattainment?

20 MR. SWINFORD: No, it would still -- it  
21 would make it -- I think make us concerned because then  
22 if we measured any in the next two years, that would put  
23 us into a nonattainment situation.

24 MS. LIVINGSTON: Immediately upon the  
25 fourth one, you would be nonattainment?

1 MR. SWINFORD: Yes.

2 MS. LIVINGSTON: And how would you go  
3 about redesignating the area back to nonattainment?

4 MR. SWINFORD: I think part of the  
5 maintenance plan -- I'll answer a different question  
6 first, I think. Part of the maintenance plan is to  
7 identify these situations before we get to the second  
8 and third exceedance and to try to mitigate it by going  
9 at the particular source that's causing the problem and  
10 therefore what we would hope would happen would be that  
11 if we did measure an exceedance early on, that we would  
12 be able to find out who the problem is and go into a  
13 situation where we could resolve that before it got to a  
14 second or a third exceedance. As far as what happens if  
15 our best efforts still get us to four in a three-year  
16 period, I don't know what the process is for  
17 redesignation. I don't know if Rob --

18 MR. KALEEL: -- I can address that. The  
19 -- if we were to hypothetically reach attainment in  
20 this area and be designated attainment and we achieved  
21 four exceedances or in violation of the standard at that  
22 point, either the state or USEPA could initiate a  
23 redesignation back to nonattainment for the area.

24 MS. LIVINGSTON: You'd have to go through  
25 hearings and everything else to redesignate it or you

1 could just administratively redesignate it?

2 MR. KALEEL: It's done through the  
3 Federal Register. It's a federal action, but it could  
4 be initiated either by the state or USEPA.

5 MS. LIVINGSTON: So let's say one of your  
6 monitors that exceeds is an every six day monitor, are  
7 you immediately on an everyday six day monitor going to  
8 consider an exceedance to kick us into the  
9 nonattainment?

10 MR. SWINFORD: Not necessarily because  
11 what we are allowed in that circumstance is to within  
12 two quarters after that occurs to go to everyday  
13 sampling at that location and at that point that one in  
14 six does not get multiplied by six if we go ahead and go  
15 to everyday sampling and then it would be at an everyday  
16 sampling schedule until we demonstrate we either go  
17 above the four exceedance or go more than three  
18 exceedances or within a year find out that we haven't  
19 had any more exceedances, then we could conceivably drop  
20 back to every six day, but we would have to go to  
21 accelerated sampling at that site.

22 MS. LIVINGSTON: And the state would pick  
23 up the cost at that site?

24 MR. SWINFORD: Yes.

25 MS. LIVINGSTON: Can you tell us what

1       samplers you're using or what reference methods?

2                   MR. SWINFORD: At the three every six day  
3 sites, we are using Sierra-Anderson 1200-B manual  
4 samplers. At the continuous or everyday sampling site,  
5 2044 Washington, we're using a Greasby-Anderson and I  
6 don't know the model number, but it's a beta  
7 continuation sampler and they are both --

8                   MS. LIVINGSTON: -- It's an approved  
9 method?

10                  MR. SWINFORD: They're both equivalent  
11 methods.

12                  MS. LIVINGSTON: Could you tell us about  
13 the wind direction frequency table for our monitors  
14 here?

15                  MR. SWINFORD: As far as --

16                  MS. LIVINGSTON: As far as what are the  
17 wind speeds and wind directions at these monitoring  
18 sites?

19                  MR. SWINFORD: Typically in this part of  
20 the state the most frequent directions are from  
21 southeast to southwest, especially during the  
22 summertime, and then in following winter we get a  
23 secondary maximum frequency from west to northwest.

24                  MS. LIVINGSTON: So what do we know about  
25 the winds, light, heavy, weird?

1 MR. SWINFORD: This part of the --  
2 St. Louis area is typical of, I guess, mainland United  
3 States. It's in an area of very fast moving frontal  
4 systems, changeable weather patterns, as everybody  
5 knows. Typically the winds are moderately strong.  
6 Summertime we get into stagnation periods where we do  
7 have light winds for days at a time, but we also get a  
8 lot of transition periods where the winds will pick up,  
9 so overall I don't think there's anything particularly  
10 unusual about the wind patterns in this part of  
11 Illinois. It's typical of mid-continent meteorological  
12 conditions.

13 MS. LIVINGSTON: You made a statement  
14 about if you did find an exceedance, that you would do  
15 an investigation and a follow-up and possibly do stack  
16 tests. Did you testify to that, Rob?

17 MR. KALEEL: Yes, I did.

18 MS. LIVINGSTON: Okay, and then you said  
19 and we would pursue enforcement if it persisted. Do you  
20 mean in the sense that if you found a violation and it  
21 wasn't -- a violation of the ambient air quality  
22 standards and that if it wasn't corrected, that you  
23 would search out where noncompliance was with the regs  
24 to enforce or did you mean that someone would get a pass  
25 on enforcement if they were already in violation and you

1 knew it?

2 MR. KALEEL: Well, I didn't mean to imply  
3 that anyone would get a pass. What our contingency  
4 measures are approaches that if we were to observe  
5 elevated concentrations in the area, just at the first  
6 exceedance or even a near exceedance, that we would  
7 begin an investigation as to what the causes were of the  
8 elevated concentrations. If we're to find that the  
9 elevated concentrations were due to a particular source  
10 being out of compliance with those emission limitations,  
11 then we would sit down through our normal enforcement  
12 procedures and discuss with the company how to mitigate  
13 that problem, how to get it corrected.

14 MS. LIVINGSTON: Good. That's good. Can  
15 you tell us --

16 HEARING OFFICER WILLIAMS: -- Just one  
17 more question and we're going to have to find out if  
18 there's other people wish to ask questions. Go ahead.

19 MS. LIVINGSTON: Could you tell us a  
20 little bit about the new controls at your larger  
21 sources, like maybe you could start by telling us who  
22 are the major contributors to your readings and then  
23 maybe just give us a slight rundown on what kind of new  
24 controls they put in to reduce from where they used to  
25 be so that we know we really did get some actual

1 reductions to bring about your data?

2 MR. KALEEL: Well, the most significant  
3 sources in this area obviously are related to iron and  
4 steelmaking, but there are others. What we have  
5 determined through our analyses was that the most  
6 significant contributor, most significant operation was  
7 traffic on unpaved roads. We call it fugitive dust  
8 emissions. They're not specifically related to a  
9 process, an industrial process, but more related to just  
10 general activity at industrial facilities. Roadways,  
11 truck traffic, automotive traffic on unpaved roads and  
12 to some extent on paved roads, as well. The types of  
13 regulations that we developed to address that require  
14 significantly greater fugitive dust control practices.  
15 In general, application of dust suppressants on unpaved  
16 roads on a specified frequency and also strict  
17 enforcement of the application through our fugitive dust  
18 control program, our field inspections office would  
19 observe the dust levels from vehicles passing at a  
20 particular facility and if they exceed a specified  
21 amount, specific opacity level, then that would  
22 constitute a violation of our regulations.

23 MS. LIVINGSTON: Opacity level. We're  
24 reading opacity off the roadways?

25 MR. KALEEL: Yes.

1 MS. LIVINGSTON: Do you have a certain  
2 percentage of control that you require?

3 MR. KALEEL: The percentages vary for  
4 different facilities, but at the biggest facilities in  
5 this area, it's a five percent opacity and it's, I  
6 believe, averaged over a three-minute period.

7 MS. LIVINGSTON: And then they have to  
8 submit a plan that tells how they would achieve that?

9 MR. KALEEL: Yes.

10 MS. LIVINGSTON: And you can balance that  
11 off against data that you know would achieve that?

12 MR. KALEEL: Yes.

13 MS. LIVINGSTON: And then they have to do  
14 -- they have to perform that control?

15 MR. KALEEL: They have to perform the  
16 measures that are specified in their fugitive dust  
17 plans.

18 MS. LIVINGSTON: What percentage of  
19 fugitives --

20 HEARING OFFICER WILLIAMS: -- Last  
21 question.

22 MS. LIVINGSTON: Can I follow up on his  
23 question -- on his answer? What percentage of fugitive  
24 dust do you think is PM-10?

25 MR. KALEEL: That's a good question. I

1 don't know specifically what the percentage is.  
2 Obviously for fugitive dust sources much of the  
3 particulate matter is greater than this ten micron  
4 fraction, but I don't know exactly what the fraction  
5 would be for an unpaved road, for example. Probably,  
6 you know, less than half would be PM-10.

7 HEARING OFFICER WILLIAMS: Okay. Are  
8 there any more questions here from the public? Yes,  
9 sir. Could you state your name for the record and who  
10 you represent?

11 MR. ARNOLD: Talking to me? Yes. Name  
12 is George Arnold, Madison County Conservation Alliance.  
13 I'm puzzled about particulates come into this designated  
14 area. Let me ask about the Chemetco plant. That's  
15 outside of this area, is that correct, that you had on  
16 the map, Chemetco plant?

17 MR. KALEEL: I guess it's --

18 MR. BIENIECKI: -- Yes, it's outside.

19 MR. ARNOLD: Is the area where Chemetco  
20 exists, is this nonattainment or is it considered to be  
21 attainment?

22 MR. KALEEL: My understanding is it's in  
23 an attainment area.

24 MR. ARNOLD: Can you tell me what the  
25 readings have been recently on the Chemetco -- near the

1 Chemetco plant in particulates, lead?

2 MR. KALEEL: I would, I guess, refer to  
3 Bob. I don't recall.

4 MR. SWINFORD: The most recent readings  
5 that we have is still the 1995 readings. They have  
6 recorded violations of the lead standard in each quarter  
7 of 1995.

8 MR. ARNOLD: Each quarter, yes?

9 MR. SWINFORD: Right. At one or more  
10 sites. I believe it was just one site per quarter, but  
11 I think it was different sites during the year.

12 MR. ARNOLD: Well, now are those  
13 exceedances having any relationship to this present  
14 consideration? Obviously the wind blows in from the  
15 north sometimes.

16 MR. KALEEL: We have accounted for the  
17 transport of particulate matter into the area in what we  
18 referred to as background concentration. We've used the  
19 monitoring data in the area to project the amount of  
20 contribution, if you will, from sources that are located  
21 outside the area, as well as other sources in the area  
22 that were not explicitly accounted for in the attainment  
23 demonstration. Very small sources.

24 MR. ARNOLD: Have you used the Chemetco  
25 information in your --

1 MR. KALEEL: -- To the extent that  
2 Chemetco contributes to the monitors in the area, then  
3 they are addressed in that way, yes.

4 MR. ARNOLD: What's the expected error in  
5 your modeling procedure?

6 MR. KALEEL: I'm not familiar with the  
7 term expected error. What are you --

8 MR. ARNOLD: What accuracy can you  
9 guarantee for your results of your modeling?

10 MR. KALEEL: Historically the modeling  
11 results have been characterized in terms of their  
12 variation or variance from a particular monitor value  
13 and in general the models have been shown to be accurate  
14 within plus or minus twenty percent. The key thing  
15 about modeling is that in the previous studies that have  
16 been done, that the models have been shown to not be  
17 biased and biased means is there a tendency of the model  
18 to overpredict or is there a tendency of the model to  
19 underpredict and the studies that have been performed by  
20 numerous groups, including industrial groups, as well as  
21 USEPA, have shown that the models are not biased. They  
22 may have some variation in terms of their accuracy, but  
23 they're just as likely to underpredict as they are to  
24 overpredict and what that would say, what that would  
25 indicate about our attainment plan is that you can't

1 judge the values, the variance that I mentioned, the  
2 plus or minus twenty percent and assume that the  
3 concentrations are underpredicted by that model. In  
4 many circumstances they overpredict and other  
5 circumstances they underpredict.

6 MR. ARNOLD: When you do your  
7 calculations toward the future and you say you're  
8 reasonably sure of the future particulate values, how is  
9 this twenty percent related to that? Do you protect the  
10 public by at least twenty percent in your calculations?

11 MR. KALEEL: We haven't built in a margin  
12 of error if that's what you're referring to. What our  
13 -- what the approach is, the overall approach, the  
14 bigger picture is that we projected these concentrations  
15 back in 1991 for the time period when industries  
16 complied with the then proposed regulations. Looking  
17 back on it or after a period of time, the companies in  
18 the area have in fact complied and in response to that  
19 we've noticed that the concentrations have dropped and  
20 in fact the concentrations based on monitoring, not  
21 modeling, are below the air quality standards. As I  
22 mentioned, we are going to continue to monitor in the  
23 area and that ultimately is the proof that we need to be  
24 able to say that the area is in attainment, so it is a  
25 projection, if you will, using the models, but we use

1 the monitors to verify that the projection was correct.

2 MS. LIVINGSTON: I don't know if you  
3 caught that, George, but what Rob testified to when I  
4 asked him questions was that his model was based on the  
5 allowables, not the actuals that are being measured in  
6 the monitor and the allowables are significantly higher  
7 than the actuals, so there would be your built-in  
8 protection in the model.

9 MR. ARNOLD: Okay.

10 MS. LIVINGSTON: Sorry, Rob.

11 MR. KALEEL: Thank you.

12 HEARING OFFICER WILLIAMS: Okay, are  
13 there any more questions from members of the public  
14 here? Hold on, sir. Okay, Miss Andria, you get to ask  
15 your questions again now. We're trying to spread it  
16 around. I don't want anybody to ask too -- I mean go on  
17 and on and on. We want to give everybody a chance to  
18 ask questions, so we will get back to you if we don't  
19 get you now. Go ahead, Miss Andria.

20 MS. ANDRIA: If you have a twenty percent  
21 plus or minus, that takes you -- if you're at 143 or  
22 whatever that is, that takes you over the top.

23 MR. KALEEL: I understand. I guess the  
24 point that I was making is that you're just as likely to  
25 go back the other way. If we were projecting 140, it

1       might -- the real value might actually be 130.

2                       MS. ANDRIA: But it might really be 160?

3                       MR. KALEEL: And again the point that I  
4       made is what we do before we can even redesignate the  
5       area, once we've made these projections, once the  
6       companies have complied and we verified that they've  
7       complied with the regulations that are consistent with  
8       attainment, we have to continue to monitor for a period  
9       of three years after that and we've done that and the  
10      monitoring is verifying our projections that we are in  
11      attainment.

12                      MS. ANDRIA: But your monitoring also  
13      does not include the changes that have been allowed from  
14      the expansion of Spectrulite and the expansion of  
15      Granite City Steel.

16                      MR. KALEEL: I appreciate that and we  
17      will continue to monitor.

18                      MS. ANDRIA: And what I'm very concerned  
19      about is that the twenty percent over, in view of the  
20      fact that USEPA is considering dropping the standard and  
21      being even more stringent with PM-5 or I mean I've even  
22      heard PM-1 or something, so it seems to me that this is  
23      -- that -- and you haven't done health studies to see  
24      that there is not a significant risk in this. I mean,  
25      twenty percent over would -- I'm starting to make

1        comments, I'm sorry.

2                    MR. KALEEL:  If I could address that,  
3        though, the air quality standards themselves are based  
4        on health studies.  Perhaps not in Granite City per se,  
5        but in many locations throughout the world, so the  
6        health aspects of the air quality standards are  
7        addressed in USEPA's deliberations on how they set the  
8        standard itself.

9                    MS. ANDRIA:  When were they studied?

10                   MR. KALEEL:  The studies that were used  
11        to set the PM-10 standards originally and the PM-10  
12        standard, I believe, was set in 1988, the studies were  
13        done in the late seventies and early eighties and, in  
14        fact, those studies continue to be done and you  
15        referenced the current discussions that are going on at  
16        the federal level about revising the particulate matter  
17        to a finer cut point, something even finer than ten  
18        microns.  Those are the result of continuing studies  
19        that continue to be done to protect human health.

20                   MS. ANDRIA:  So that these studies that  
21        were done to set the limits have not taken into effect  
22        the Douglas Dochtery [ph] studies on PM-10 which were  
23        done in like '93, '94, '95?

24                   MR. KALEEL:  I'm not familiar with those  
25        specific studies, but all the present health studies

1 that are available to USEPA are being considered by  
2 USEPA in their review of the particulate matter  
3 standards. I think I mentioned just briefly that  
4 USEPA's required by the Clean Air Act to review the air  
5 quality standards, not just particulate matter, but all  
6 criteria pollutants every five years and they're in the  
7 middle right now of looking again at the particulate  
8 matter standards and are considering whether or not  
9 those standards should be revised.

10 MS. ANDRIA: Given the fact that you said  
11 that the change would allow not having to have New  
12 Sources -- have the New Source -- whatever that's  
13 called, I can't remember.

14 MR. KALEEL: The New Source Review  
15 Program.

16 MS. ANDRIA: Right.

17 MR. KALEEL: Okay.

18 MS. ANDRIA: That in between the time  
19 that USEPA decides that yes, PM-1 is really what should  
20 have been the standard, a new plant could be sited or  
21 three or four or five. Now people are -- they have to  
22 consider jobs, but if you -- if you change this now,  
23 then there will be a new plant that can come in and that  
24 the people will not be protected against that in the  
25 meantime while the scientific data's being sorted out.

1 MR. KALEEL: If I might talk a little bit  
2 about the PSD process. If any new source was to be  
3 located in this area, under the Prevention of  
4 Significant Deterioration Rules as opposed to New Source  
5 Review, if it's considered a major source, one of the  
6 requirements, and this is a requirement in PSD that's  
7 not in New Source Review, is that that source has to  
8 perform an air quality study and that study might  
9 involve additional monitoring. It certainly involves  
10 additional air quality modeling to show that the new  
11 emissions in conjunction with all the existing emissions  
12 will not cause violations of the air quality standard.

13 MS. ANDRIA: Well, what exactly is a  
14 major source?

15 MR. KALEEL: It depends on the source  
16 category. For many sources for PSD it's considered  
17 major if the potential emissions exceed two hundred  
18 fifty tons per year; however, there's a listed group of  
19 source categories, there's twenty-eight source  
20 categories that are specifically listed in the Code of  
21 Federal Register -- Code of Federal Regulations that the  
22 threshold is only a hundred tons and that's the same  
23 threshold that applies for New Source Review.

24 MS. ANDRIA: How many facilities do we  
25 have here contributing to PM-10?

1 MR. KALEEL: I don't recall  
2 specifically. I believe it's about thirty.

3 MS. ANDRIA: So this then -- there are  
4 thirty sources. How many of them are major?

5 MR. KALEEL: Well, just a word about my  
6 terminology, I guess there's thirty sources which would  
7 encompass all emission units at a particular company. A  
8 particular steel mill, all the emission units within a  
9 steel mill based on our terminology are a source and  
10 what I referred to, there are something like thirty  
11 sources, companies with many, many individual emission  
12 units, probably closer to three hundred emission units  
13 at those thirty sources. The terminology's sort of  
14 confusing, but -- and I don't recall exactly how many --

15 MS. ANDRIA: -- Thirty sources meaning  
16 facilities and three hundred meaning actual places where  
17 it comes out?

18 MR. KALEEL: Emission points, right.

19 MS. ANDRIA: Okay.

20 MR. KALEEL: And I don't know exactly  
21 which ones of those are considered major, but my guess  
22 is that most of them are.

23 MS. ANDRIA: Why do we have only one week  
24 for public comment?

25 MR. KALEEL: I can't answer the way the

1     thing was scheduled.  If the -- if you need more time, I  
2     think we can talk with you about that.

3                   MS. ANDRIA:  I mean, we don't have -- I  
4     mean, this is a very serious thing here that you're  
5     doing and it seems to me that I think it's not only  
6     justified, but it's mandated that you give more time.

7                   MR. KALEEL:  We appreciated that and we  
8     can talk with you about that.

9                   MS. ANDRIA:  You said that the monitor is  
10    chosen to indicate the population exposure.  The place  
11    that you moved it from was lower, significantly lower  
12    than the place that it was moved to, so it seems to me  
13    that you have accounted for the difference that people  
14    will not -- that is not going to be reflective of street  
15    dust.  The new location.

16                  MR. KALEEL:  My guess is that the new  
17    location is picking up significant contributions from  
18    street dust and industrial dust and anything that would  
19    contribute to the total atmospheric loading in the area  
20    would be picked up by the monitor.

21                  MS. ANDRIA:  Is it protected at all from  
22    the street?  I mean, how many stories high is it?

23                  MR. KALEEL:  I guess I refer to our  
24    monitoring staff.

25                  MR. HENRY:  It's just one story.

1 MR. KALEEL: Our siting criteria, though,  
2 are very specific in the way we locate monitors that we  
3 not be adversely affected by any real micro scale, if  
4 you will, if I can use that term, very local scale  
5 effects. It's supposed to represent more of a broader  
6 area or broader coverage.

7 MS. ANDRIA: Well, there's -- the one  
8 that's located on Nameoki, where exactly is that  
9 located?

10 MR. HENRY: It's Plaza Furniture. It's a  
11 business in that area.

12 MS. ANDRIA: There are -- at the last  
13 meeting, the hearing that you had on the expansion of  
14 Granite City Steel, I asked if there couldn't be a  
15 monitor located near the school, Lake School. Has there  
16 been any inquiries into that?

17 MR. SWINFORD: Not at this point.

18 MS. ANDRIA: Since there are people  
19 living much closer than that furniture store right  
20 across from the coke by-products plant and the piles and  
21 everything, is there a reason that there is not one  
22 closer?

23 MR. SWINFORD: I guess not really. Back  
24 in the days where we were doing PS -- or TSP monitoring,  
25 we had much more extensive network and as we evolved to

1 PM-10, we found out that PM-10 is a more broadly  
2 influenced influent than TSP was and therefore the  
3 network could easily be taken to smaller numbers yet  
4 without loss of specific information. In other words,  
5 being right across from the source didn't seem to  
6 necessarily make as much difference for PM-10 as it did  
7 for TSP, and so there is a possibility that we can  
8 always reevaluate the network, but I think we feel that  
9 the site on Nameoki is probably representative of most  
10 areas at that end of town.

11 MS. ANDRIA: The people who live just  
12 across that highway in that area and the people at the  
13 school tell me that there is like always dust, I mean  
14 they can go and they can dust five, six, eight, ten  
15 times a day and it's always there. What percentage of  
16 that would be PM-10 particles?

17 MR. SWINFORD: I guess I really don't  
18 have an estimate of that. My assessment would be it  
19 would be less than fifty percent. TSP, the stuff that  
20 you end up wiping off would be more the larger particles  
21 and the PM-10 are the much smaller that stays in the air  
22 much longer and can be more uniform over greater  
23 distances and the TSP is going to fall out much closer  
24 to the sources and I think within that range that the  
25 PM-10 would probably still be fairly consistent

1 throughout that area where the particulates they're  
2 wiping off is probably the bigger particles and more  
3 related to TSP fallout.

4 MS. ANDRIA: So there would be like fifty  
5 percent PM-10 and fifty percent TSP?

6 MR. SWINFORD: That's just a very rough  
7 estimate. What we see on ratios -- we're still doing  
8 TSP monitoring in the area and what we see on ratios  
9 between twenty-four hour averages of PM-10 and TSP are  
10 typically in the, say, thirty percent to sixty percent  
11 ratio on any given day. I think the average is probably  
12 around forty percent in the actual air between ratio of  
13 PM-10 to TSP.

14 MS. LIVINGSTON: What do you mean, forty  
15 percent of your TSP is PM-10?

16 MR. SWINFORD: Is PM-10, right.

17 MS. ANDRIA: Given that there --

18 MR. BIENIECKI: -- TSP is total --

19 MS. ANDRIA: -- Total suspended  
20 particulate.

21 MS. LIVINGSTON: Total suspended  
22 particulate.

23 MR. BIENIECKI: That's the whole bit?

24 MR. SWINFORD: That's all of it.

25 MR. BIENIECKI: As far as particulates

1 go. As far as dusts go.

2 MS. ANDRIA: Given that there are  
3 children going to that school and they're wiping it off,  
4 would these children not be breathing part of it, the  
5 fifty percent of the --

6 MR. SWINFORD: -- Unquestionably.

7 MS. ANDRIA: Why didn't you do studies on  
8 health?

9 MR. SWINFORD: I guess as -- I'm not sure  
10 the answer to that. As an agency, we're not really  
11 geared up to do the expertise of health. We rely on the  
12 USEPA to provide us with the information needed to  
13 assess health impacts and then implement those  
14 procedures. We could possibly in conjunction with the  
15 Illinois Department of Public Health do health effect  
16 studies and we have in specific instances in the past,  
17 so that would not preclude doing that, but it would  
18 probably -- it would be in conjunction with other  
19 agencies rather than as Illinois EPA.

20 MS. ANDRIA: Do you not think that that  
21 would be a good idea to do for something this important  
22 and its ramifications?

23 MR. SWINFORD: I guess it -- you know,  
24 it's something we should consider and look into. I  
25 guess I don't know what type of -- we'd have to look

1     into scope and what would be involved in it and what, I  
2     guess, the whole procedure would -- you know, how that  
3     would work, but, you know, certainly something to  
4     consider.

5                   MR. KALEEL:  It is our position that the  
6     air quality standard is protective.  That is the purpose  
7     of the standard.  That's why we have developed our  
8     plans.  That's why we're monitoring in the area.

9                   MS. ANDRIA:  But you haven't made any  
10    efforts to find out in actuality if there are not, say,  
11    sixty percent of the population with asthma or  
12    bronchitis or bronchial asthma or emphysema or cancer or  
13    heart disease to find out any of those things that are  
14    all the result of PM-10.

15                  MR. KALEEL:  I understand.  I also  
16    understand it's very, very difficult to attribute any  
17    specific health problem to any specific pollutant, so  
18    that it's very complex, very difficult to do studies of  
19    that type and attribute it specifically to a given  
20    pollutant.

21                  MS. ANDRIA:  Would it be within the scope  
22    of your ability to do so to consult local pulmonary  
23    specialists and the local -- we have cardiopulmonary  
24    specialists right here in Granite City who have a  
25    thriving business.

1                   MR. KALEEL: Well, as of right now, I'm  
2 not aware there is a state program that would allow us  
3 to do that type of a study.

4                   MS. ANDRIA: Does -- is there -- does  
5 there not exist within USEPA -- doesn't USEPA have to  
6 approve your SIP?

7                   MR. KALEEL: Yes, they do.

8                   MS. ANDRIA: So is there not -- I mean,  
9 with CDC or ATSDR, is there not a capacity to do that  
10 before redesignating this area?

11                  MR. KALEEL: It isn't a component of what  
12 is required for PM-10 in State Implementation Plan, but  
13 certainly the capability exists at the federal level,  
14 but it isn't a component of our planning requirements.

15                  MS. ANDRIA: How soon do you plan to put  
16 this into effect?

17                  MR. KALEEL: There's a federal process  
18 that needs to take place. At the point that we've had  
19 our public hearing, we would address the comments from  
20 this hearing and any other comments that we receive, any  
21 written comments in our Responsiveness Summary and  
22 provide that information to USEPA, then USEPA has to do  
23 their normal rule making, they would have to publicize  
24 in the Federal Register, receive comments at the federal  
25 level and then take final action, so my guess is it

1 would take a year.

2 MS. ANDRIA: And we do have more than one  
3 week to comment?

4 MR. KALEEL: We'll talk with you about  
5 that.

6 MS. ANDRIA: Okay.

7 MR. KALEEL: I think we can work that  
8 out.

9 MS. ANDRIA: I'll let somebody ask some  
10 more questions. I'll be back.

11 HEARING OFFICER WILLIAMS: Okay, yes,  
12 sir.

13 MR. BIENIECKI: Henry Bieniecki. Could I  
14 have the plot back? It strikes me that the station at  
15 15th Street which I gather from reading material that I  
16 got in the mail has the highest readings. Does that  
17 correlate with wind directions, that that should be the  
18 highest reading station?

19 MS. DOCTORS: Excuse me?

20 MR. KALEEL: 15th Street. It's sometimes  
21 difficult to say that a peak concentration will always  
22 occur in conjunction with the predominant wind direction  
23 in an area. Given meteorological condition, especially  
24 on a short-term basis could be coming from any specific  
25 direction in this case perhaps.

1 MR. BIENIECKI: There aren't average --

2 MR. KALEEL: On annual averages you  
3 typically would expect that, but there's other factors  
4 to consider and in particular the locations of the  
5 sources near the monitor. If the -- if the biggest  
6 sources are to the north of the monitor, then you would  
7 expect a northerly wind or wind moving in a southerly  
8 direction to be attributed with the highest  
9 concentrations. It wouldn't necessarily be the  
10 predominant wind for the area. Most frequently  
11 occurring winds for the area. It's just the direction  
12 that lines up the monitor with the particular source.

13 MR. BIENIECKI: My experience is that, as  
14 you indicated earlier, seemed to me, that the summer  
15 winds, warm weather winds were from the southeast and  
16 southwest which I think is a fair observation in my  
17 experience of seventy years of living in this area and  
18 that the winter winds are more westerly and northerly.  
19 Either set of those, and my general observations over  
20 many years that since BOF's been here, which is like a  
21 quarter of a century, that the BOF is a principal player  
22 in particulates in this area. Always has been and  
23 probably there's a good chance of always continuing to  
24 be, but, anyway, BOF doesn't relate to that wind pattern  
25 where that 15th Street station? Do you have any

1       comments on that?

2                   MR. KALEEL:  I don't have any real  
3       specific comments other than to point out that there are  
4       a number of unpaved roads directly to the north of that  
5       facility that would also contribute heavily to the  
6       loading at that monitor.  So it wouldn't just be the  
7       effects of the BOF.  It would be other effects, as  
8       well.

9                   MR. BIENIECKI:  Okay, is PM-10 visible to  
10      the human eye?

11                  MR. MOORE:  An individual particle of  
12      PM-10 is not visible to the human eye.  If there are  
13      sufficient number of PM-10 particles suspended in the  
14      atmosphere, there will be an attenuation of vision and  
15      hence opacity, but --

16                  MR. KALEEL:  -- Haze.

17                  MR. MOORE:  A haze, but there -- for  
18      example, when you see dust that you wipe off, none of  
19      the stuff that you see that you're wiping is PM-10.  
20      It's much too big.

21                  MR. BIENIECKI:  If it was all PM-10, you  
22      wouldn't notice it, is that accurate?  If you had a  
23      layer of PM-10 on your automobile, you wouldn't know --  
24      you wouldn't see it?

25                  MR. MOORE:  Well, if there were enough of

1 it, you would see something, but you wouldn't be able to  
2 differentiate particles.

3 MR. BIENIECKI: Okay.

4 MR. MOORE: But particles of that size  
5 will not lay on your automobile. They'll be suspended  
6 in the air.

7 MR. BIENIECKI: Floating, okay. Have  
8 there been any improvements in BOF emissions that's  
9 reflected in the monitoring?

10 MR. KALEEL: Jeff, are you --

11 MR. BENBENEK: In the actual emissions,  
12 you said? Because last year Granite City Steel put on a  
13 new section to their ESP, electrostatic precipitator,  
14 which improved the performance of their control  
15 equipment from that point -- from that point forward.  
16 If I'm -- if that's the question you're asking --

17 MS. LIVINGSTON: So how many plates do  
18 they have in the ESP now?

19 MR. BENBENEK: Number of plates I can't  
20 tell you, but it's now a -- from a section standpoint,  
21 there's now eight sections. There used to be just six.

22 MS. LIVINGSTON: Okay.

23 MR. BIENIECKI: Was it the control of  
24 road dust and fugitive emissions the factor in being  
25 able to attain the PM-10 standard?

1 MR. KALEEL: That in conjunction with  
2 certain other reductions at the process sources or the  
3 point sources, but mostly it's fugitive dust, yes,  
4 improvements of fugitive dust that allowed us to  
5 demonstrate attainment.

6 MR. BIENIECKI: You're not claiming an  
7 improvement in BOF emissions?

8 MR. KALEEL: Well, the main improvement,  
9 I think, as Jeff discussed, was an improvement in the  
10 precipitator for that source.

11 MR. BIENIECKI: When did that -- when was  
12 that installation, Jeff?

13 MR. BENBENEK: That was last -- that was  
14 last year in mid to the third quarter of '95.

15 MR. BIENIECKI: That's well after the  
16 time that you made this decision that attainment was  
17 achieved, so I would gather then, is it correct to say,  
18 that --

19 MR. KALEEL: -- The attainment plan did  
20 not require specific further actions on the BOF.

21 MR. BIENIECKI: Right.

22 MR. KALEEL: The additional controls, I  
23 think, were more associated with the permit, but they  
24 were necessary to continue to attain the standard.

25 MR. BIENIECKI: My recollection is that

1 the BOF, that the high emissions that were -- that over  
2 several decades, over two decades that were associated  
3 with the BOF were from random or episodic type of  
4 situation, whether they were operational or failures of  
5 some kind, I don't know, but the control of fugitive  
6 dust, it seems to me, is a more consistent thing. It's  
7 associated with automotive operations which are fairly,  
8 say, fairly uniform -- not uniform, but fairly  
9 consistent everyday type of things where the problems  
10 with the BOF, you know, something could go wrong, you  
11 just see these big pink clouds that billowed out and  
12 covered the area and you're saying that -- what I  
13 understand is that the road dust control was sprayings  
14 of water and things of that sort covering piles of  
15 material, although I haven't seen any of that, I don't  
16 know how you handle the piles, but that you're saying  
17 that's the big contribution to achieving PM-10. You're  
18 not making any claim on the BOF, but it seems to me that  
19 the BOF was the thing that drove these high peak values  
20 that knocked the area out of attainment. Do you have  
21 any comments about that?

22 MR. KALEEL: Well, I guess my reaction to  
23 that is that there isn't any one single source that was  
24 causing the problem, that it was a combination of  
25 different things and, in fact, the worst problem was, in

1 fact, fugitive dust and that is how we targeted our  
2 State Implementation Plan and our monitoring data  
3 suggests that it's working.

4 MR. BIENIECKI: You said a few moments  
5 ago that you think the site at 2044 Washington reflects  
6 that fugitive dust problem as did the one at 20th and  
7 Omaha, is that accurate?

8 MR. KALEEL: Don't recall addressing the  
9 one at 20th and Omaha. I think it's fair to say that  
10 any of the monitors in the area are being affected  
11 significantly by fugitive dust throughout the steel  
12 making and slag handling operations and in addition to  
13 that, just the normal urban road dust on any of the  
14 roadways throughout the town.

15 MR. BIENIECKI: I don't think they do any  
16 water spraying up through the town. The place where  
17 they got the -- where the water spraying is done is  
18 within the -- principally within the fences of the steel  
19 company. Fences don't go up into the residential  
20 areas.

21 MR. KALEEL: Well, what I'm saying is  
22 that the monitors are picking up everything that's  
23 contributing to particulate air quality in the area and  
24 certainly mobile sources contribute to that, fuel  
25 combustion sources were contributed to that, industrial

1 operations contributed to that. The monitor doesn't  
2 distinguish which particles it's going to capture. It's  
3 going to capture all of it and based on our analyses,  
4 the most significant source that was causing ongoing  
5 problems in this area were the fugitive dust sources,  
6 the vehicular traffic primarily at the industrial  
7 facilities, but not exclusively.

8 MS. LIVINGSTON: Did those fugitive dust  
9 sources include coal piles or coke piles?

10 MR. KALEEL: Yes.

11 MS. LIVINGSTON: And did they include  
12 like, say, the BOF's doorway or sources that you now  
13 regulate as no VE?

14 MR. KALEEL: Yes.

15 MS. LIVINGSTON: Those were considered  
16 your fugitives that attributed to the nonattainment  
17 before?

18 MR. KALEEL: The fugitives I'm talking  
19 about are more the unpaved roads and piles, loading and  
20 unloading operations, things of that nature. The BOF  
21 fugitives were considered in the modeling and, in fact,  
22 one of the regulations that is now before the Pollution  
23 Control Board is significant tightening of the fugitive  
24 emissions from the BOF from a thirty percent opacity  
25 with equivalent of an eight-minute observational time to

1 a twenty percent opacity with a three-minute  
2 observational time.

3 MS. LIVINGSTON: Really? But they have  
4 continuous monitoring on it? Do they have a continuous  
5 monitoring device on it?

6 MR. KALEEL: Don't believe there is a  
7 requirement for continuous opacity monitoring.

8 MS. LIVINGSTON: Because it's fugitive,  
9 so you couldn't?

10 MR. BENBENEK: Right.

11 MS. LIVINGSTON: But have it on the  
12 stack?

13 MR. BENBENEK: The stack, yes.

14 MS. LIVINGSTON: Can you enforce the  
15 fugitive dust plan independent of the five percent  
16 opacity reading?

17 MR. KALEEL: Yes, we can.

18 MS. LIVINGSTON: Cool. Way to go.

19 MR. KALEEL: Thank you.

20 MS. LIVINGSTON: Very good. Bob, can you  
21 tell us about this -- I'm sorry, go ahead.

22 HEARING OFFICER WILLIAMS: Excuse me,  
23 ma'am. You had the floor actually.

24 MS. LIVINGSTON: You're too slow.

25 HEARING OFFICER WILLIAMS: Go ahead,

1     sir.

2                   MR. BIENIECKI: Does this proceeding have  
3 any review by the Illinois Pollution Control Board? Do  
4 they have any input into this?

5                   MR. KALEEL: In the maintenance plan,  
6 no. The maintenance plan, as I mentioned before, would  
7 be sent to USEPA and USEPA would be the final agency to  
8 review it and approve it.

9                   MR. BIENIECKI: With respect to this  
10 fugitive dust, I'd like to point out that from an  
11 ordinary citizen viewpoint, resident viewpoint, I drive  
12 through there frequently down 20th Street, 21st Street  
13 and it's crossed over by material movers which are  
14 probably twenty-five, thirty-ton vehicle with tires that  
15 are four or five feet wide and ten or twelve feet in  
16 diameter and it raises a lot of dust. It is not in the  
17 same league with the vehicles that traverse Washington  
18 Avenue around the hospital. I can't imagine how you  
19 could compare the fugitive dust problems in the  
20 industrial area south of there within the fences of the  
21 company and its crossing points. Everything is cinder  
22 there for blocks around. The entire surface area of the  
23 company of Granite City Steel is either cinders, crushed  
24 rock or asphalt paving and its fugitive problems have  
25 got to be a lot worse than the ordinary problems in

1 Granite City or the ordinary problems you'd have in any  
2 community. Yet seems to me like you're trying to equate  
3 those two. You have any comments on that?

4 MR. KALEEL: I don't know that I'm trying  
5 to equate those or suggest that urban road dust is bad  
6 or worse than the road dust that is generated at the  
7 steelmaking operations. It is, in fact, those very same  
8 vehicles that you described traveling on the cinder  
9 roads or the unpaved roads, the very large trucks that  
10 are moving materials throughout the steelmaking  
11 operation, that's specifically the focus of our fugitive  
12 dust program. Those particular sources. And our field  
13 engineers will observe the dust that is kicked up by the  
14 vehicular traffic, the action of the tires on those  
15 roadways and if the dust emanating from those trucks is  
16 excessive, that would constitute a violation of our  
17 rules.

18 MR. BIENIECKI: How often do you do  
19 that?

20 MR. KALEEL: I'll refer to our field  
21 people.

22 MR. BENBENEK: Well, when we go out to  
23 the facilities and do our normal inspections, we will  
24 see if there seems to be a road that's causing a problem  
25 or particular source. At that point that would trigger

1 us to do some formal readings which is how we would have  
2 to back up those observations.

3 MR. BIENIECKI: Ringleman reading?

4 MR. BENBENEK: No, these would be Method  
5 9. Code of Federal Regulations. This is not  
6 Ringleman. And as Rob said, the percent opacity that  
7 we're dealing with on the roadways in this area is five  
8 percent. That's very stringent. The one difficulty  
9 with those is that you'd have to wait for a certain  
10 number of vehicles to pass before you could -- before  
11 you could get a valid observation. It's an averaging  
12 technique that's used in the regulations, but as I say,  
13 when we have done our inspections in the past, we've  
14 discussed the fugitive programs with the companies  
15 involved and if there -- at this point we've not had to  
16 do any formal readings of any roadways because, as I  
17 said, when we go out, we look and if we see road -- if  
18 we were to have seen a roadway that seemed to be a  
19 problem, we would have conducted observations from that  
20 point forward.

21 MR. BIENIECKI: How many times do you  
22 come to Granite City during a month and at what times of  
23 the day do you come?

24 MR. BENBENEK: Well, normally our hours  
25 are 8:30 to 5. I can't give you a specific frequency as

1 to how many times we're in Granite City. Depending on  
2 the time of year, it may be numerous times, numerous  
3 times a month when we're in the city. Sometimes in the  
4 winter months we don't get out here quite as much.

5 MS. ANDRIA: As many as how many?

6 MR. BENBENEK: But we do --

7 MS. ANDRIA: -- As many as how many in a  
8 month?

9 MR. BENBENEK: I would say some months  
10 we're out here in the area at least once a week at times  
11 and not just on plant, but in formally off site, as  
12 well.

13 MR. KALEEL: I might add a comment along  
14 these lines. In addition to our own inspections of the  
15 facilities in the area, as part of the fugitive dust  
16 plans that the company's required to submit to us,  
17 there's requirements for record keeping. In other  
18 words, we want to know how often they're applying  
19 chemical dust suppressant on a roadway if that is their  
20 compliance methodology that they chose, so if the  
21 company has not been applying the chemical dust  
22 suppressants at the frequency that they're supposed to,  
23 whether or not we've actually observed a problem, that  
24 would constitute a violation of our rules, so there is a  
25 continuous enforcement capability.

1                   MR. BENBENEK: They have to periodically  
2 send us quarter -- they have to send out quarterly and  
3 annually reports on their fugitive dust programs, as  
4 well.

5                   HEARING OFFICER WILLIAMS: Okay. I'm  
6 going to call an adjournment for one hour so everybody  
7 can go off and have lunch. It's about five past twelve  
8 now. So we will reconvene at one o'clock. I will then  
9 take the witnesses who wish to comment starting off with  
10 Mr. Bieniecki, Mr. Charles Westelhoff [ph] and Kathy  
11 Andria. If anybody else wishes to make comments at that  
12 time, maybe they can fill out a card or if they've  
13 already filled out a card, let me know. Okay. The  
14 hearing is adjourned for one hour.

15                   (Whereupon a recess was taken, after which the  
16 following transpired.)

17                   HEARING OFFICER WILLIAMS: Back on the  
18 record. At this time I call Mr. Henry Bieniecki.  
19 Mr. Bienicki, go ahead, sir.

20                   MR. BIENIECKI: Bieniecki. I don't have  
21 any formal comments to present. Most of my earlier  
22 testimony covered the specific and technical comment.  
23 The general comment I have is that seems to me this is a  
24 very important development for this community and that  
25 it does not appear to me to be anything urgent about

1 this procedure. I haven't heard any response to the  
2 questions indicating urgency and my feeling is that this  
3 should proceed at a judicial sort of pace and the  
4 tradition is that the wheels of justice grind slowly. I  
5 would like to see this thing grind somewhat more slowly  
6 so that the community, that the average person in the  
7 community that doesn't stay in touch with these kind of  
8 things have more opportunity to be involved. I think  
9 that completes my general comment.

10 HEARING OFFICER WILLIAMS: Thank you very  
11 much, Mr. Bieniecki. At this time I'd like to call  
12 Miss Kathy Andria. Yeah, Miss Andria, would you like to  
13 make a comment, please?

14 MS. ANDRIA: I'm going to make my  
15 comments in writing, but I would like to say that I  
16 agree there are so many questions that haven't been  
17 answered yet and there seems to be a rush to judgment,  
18 to quote some famous recent people, but there seems --  
19 you are all very happy with that the exceedances show  
20 that it's not going to exceed -- that you're going to  
21 remain attainment. I think the local people are much  
22 more concerned with what they see, what they smell, what  
23 their health effects are and I was talking to a woman  
24 yesterday who was unable to come today because she has  
25 her husband -- had to take her husband to the hospital

1 who has heart disease and emphysema and lives near the  
2 plant and she has observed and told me to mention to her  
3 -- she will try to submit written comments, but that  
4 she's observed several recent, just in the last few  
5 weeks, episodes of high smog, high soot, sooty  
6 conditions which we are to believe either is fifty  
7 percent or ten percent must be PM-10 in there and at a  
8 previous -- at the previous Granite City Steel expansion  
9 permit hearing, I mentioned to you about the twenty-one  
10 young children at a school in Madison, a grade school in  
11 Madison that have asthma, that the principal said have  
12 asthma. The effects of the -- long-term effects of  
13 health could be -- with the older people could be the  
14 results of many years of breathing this, but I don't see  
15 that you can make a case that since you're saying  
16 there's not been -- there has been attainment for three  
17 years and that all of the diseases, the asthma, the  
18 bronchitis are documented results of PM-10, I think that  
19 it's really incumbent upon you to study further in order  
20 to protect the health and welfare of the local people  
21 and there's no way that these children could be the  
22 results of long-term effects. They're grade school  
23 children. I was -- had a girl, we had a local parade  
24 here on Friday and one of the girls in the parade said  
25 she couldn't march unless it rained because she has

1     asthma and luckily it rained and she could march, but  
2     these are the things that the everyday people are  
3     dealing with everyday and it's very, very hard. I  
4     understand you in Springfield -- I don't think you  
5     addressed -- I didn't hear you address the effects of  
6     temperature inversions and what we have to deal with in  
7     summer and those -- that smog stays in. I mean, it's  
8     ozone and VOC's and now we're going to have increased  
9     sulfur dioxide which according to your own document says  
10    that there is a synergistic effect and that when you  
11    breathe sulfur dioxide and ozone together, it's much  
12    more damaging to the lungs and given that these are --  
13    that we're living with this expansion of Granite City  
14    Steel plant, the expansion of the production of  
15    Spectrulite, the possibility of all of the new places  
16    that want to come in, I would really hope that you would  
17    not rush to judgment on this and that you would take all  
18    of the health effects of the people and do a more -- a  
19    better, more all-encompassing judgment as to  
20    attainment.

21                   HEARING OFFICER WILLIAMS: Thank you,  
22    Miss Andria. Are there any other members of the  
23    audience here that wish to make comments at this time?  
24    Okay. I'd like to address one thing that Miss Andria  
25    brought up and that is concerning the closure of the

1 record. Okay, at the present time the record date is  
2 May the 13th, 1996. That was the date that I was  
3 requested to close the record on by the Bureau of Air.  
4 I've talked with members of the Bureau of Air here and  
5 as a consequence, I'm going to extend the hearing record  
6 up to and including June the 5th, 1996, for comments.  
7 Okay, so everything up till midnight, June the 5th,  
8 1996, I will accept into the record, so if you'd let  
9 your people know, anybody and also that lady that you  
10 mentioned who's going to send in comments, maybe you  
11 could take some comment forms back for her so that she  
12 could use those. Okay, at this time there being no more  
13 comments, I would ask are there any more questions and  
14 I'm sure there are.

15 MS. ANDRIA: Yes.

16 HEARING OFFICER WILLIAMS: Miss Andria,  
17 do you have any more questions?

18 MS. ANDRIA: Yes, for the way that it's  
19 handled from here, when -- after you go from here, will  
20 there be -- will the transcript be available to the  
21 public?

22 HEARING OFFICER WILLIAMS: Upon request.

23 MS. ANDRIA: And how soon would that be  
24 done?

25 HEARING OFFICER WILLIAMS: Well, the

1 transcript would take about ten days before, I'm  
2 advised, so probably within about two weeks.

3 MS. ANDRIA: And I spoke with  
4 Miss Doctors and she said that -- because there are a  
5 number of documents that I would like to examine.

6 HEARING OFFICER WILLIAMS: All right. If  
7 you will be specific as to the documents that you  
8 require to examine and then either let her know now or  
9 Fax her what --

10 MS. DOCTORS: -- Yeah, if it's possible,  
11 I'll give you my Fax number, I'll state it for the  
12 record, it's (217) 524-4710 and it is much easier for me  
13 if I get a written list because then I can check off  
14 what it is that I have or if I can't get it, I can  
15 respond.

16 MS. ANDRIA: Okay, is this to be in the  
17 form of a request or a FOIA request, just --

18 MS. DOCTORS: Just a letter and if I can  
19 get it by Friday. If you get it to me by Friday, I can  
20 respond.

21 MS. ANDRIA: Okay, who's the FOIA officer  
22 for Air?

23 MR. FROST: Betty Ascher or Jan McDow.

24 MS. ANDRIA: Jan?

25 MR. FROST: Yeah, you'd probably actually

1 send it to Jan McDow, M-C-D-O-W.

2 MS. DOCTORS: Probably should go through  
3 me because there is --

4 MR. FROST: -- You're asking who the FOIA  
5 officer is. When it comes to public comments and public  
6 notice or public hearings, you don't go through FOIA.  
7 You go through me or in this case you can go through --

8 MS. ANDRIA: -- I meant for documents for  
9 like monitoring and enforcement.

10 MR. FROST: Yeah, as long as it's within  
11 the context of the hearing, we can provide that to you  
12 outside of the FOIA process because they take a little  
13 bit longer. If it's something you want that's outside  
14 of the hearing, the contents of the hearing, you know,  
15 or doesn't directly relate to the hearing, then you  
16 should go through FOIA.

17 MS. ANDRIA: You have all the fugitive  
18 dust plans and --

19 MS. DOCTORS: I will walk around and talk  
20 to the people and get the information you require.

21 MS. ANDRIA: Okay.

22 MS. DOCTORS: You know, to the best of my  
23 ability.

24 MS. ANDRIA: Okay. Okay, how many  
25 variances have been allowed for facilities in this --

1 MS. DOCTORS: To the best of my  
2 knowledge --

3 MR. BENBENEK: Just Spectrulite.

4 MS. DOCTORS: -- just Spectrulite.

5 MS. ANDRIA: Just Spectrulite. Was  
6 Granite -- was American Steel open the full time of the  
7 three years that you used to determine that it was  
8 attainment?

9 MR. BENBENEK: I don't know that they  
10 were operating full or even near full capacity during  
11 the three-year period.

12 MS. ANDRIA: Because they were closed for  
13 several years during that time.

14 MR. BENBENEK: Yeah, right. Correct.

15 MS. ANDRIA: So did you take that into  
16 effect into your computer modeling?

17 MR. KALEEL: When we did the computer  
18 modeling, we assumed that they were operating at full  
19 load and that all the companies were operating at full  
20 load.

21 MS. ANDRIA: And you think Spectrulite's  
22 the only one that has a variance?

23 MS. DOCTORS: For PM-10, yes.

24 MS. ANDRIA: Okay. How many site  
25 specific rule makings have there been promulgated for

1 facilities here in this area?

2 MR. KALEEL: For PM-10, I guess I'm not  
3 aware of any.

4 MR. BENBENEK: No.

5 MR. BIENIECKI: In the attainment area?

6 MR. KALEEL: In the nonattainment area?

7 MR. BIENIECKI: Pardon?

8 MR. KALEEL: In the nonattainment area,  
9 that was your question?

10 MR. BIENIECKI: Right.

11 MR. KALEEL: Yeah, I guess I'm not aware  
12 of any. We can check.

13 MR. BENBENEK: I mean, the regulations,  
14 if you read some of the PM-10 regs that we have, it's  
15 obvious that a certain -- some of the regulations were  
16 pointed directly towards certain facilities, but as far  
17 as anybody that's gotten what we would call a site  
18 specific rule, I don't think we've seen any.

19 MS. ANDRIA: Because I was reading -- how  
20 exactly -- and I haven't been able to determine that  
21 just from reading, but the document that I showed you,  
22 the visible particle emission, Pollution Control Board  
23 thing.

24 MS. DOCTORS: Oh, the second notice?

25 MS. ANDRIA: Right, what is its -- what

1 is the status of it and how does it relate to this  
2 proceeding?

3 MS. DOCTORS: Okay, the status of this is  
4 it was just approved by the Joint Commission for  
5 Administrative Rules, JCAR, which is the second notice  
6 with no objection, so the Board -- it should go final --  
7 we should have a final Board order on May 31st. This is  
8 not -- this is tangentially related to what we're doing  
9 today. This addresses some items that USEPA raised with  
10 respect to our attainment demonstration. They did a  
11 conditional approval and this addresses some of those  
12 items.

13 MS. ANDRIA: Why was a hearing held in  
14 Chicago but not one here?

15 MS. DOCTORS: I -- that's difficult for  
16 me to address because it's the Pollution Control Board  
17 that sets the hearing and this is -- this rule had  
18 state-wide applicability, so there's two things, but I  
19 can't specifically tell you why they chose Chicago.  
20 There was -- there were originally two -- there were  
21 three hearings set and the first one was set in Chicago  
22 and I think the second one was set in Springfield, but  
23 there was no request for that second hearing.

24 MS. ANDRIA: Since it was only Chicago  
25 and Granite City that were -- it says that are addressed

1 in this, I mean, I can't understand why we were not  
2 granted a hearing, an opportunity for comment.

3 MS. DOCTORS: As I said, the Illinois EPA  
4 does not schedule or set up the hearings on the rules.  
5 That's with the Board and this does -- this says general  
6 cleanup items that affect the state, but nothing --  
7 nothing in terms of control requirements except in the  
8 Lake Calumet and Granite City areas.

9 MS. ANDRIA: Is there any way -- I mean,  
10 there seems to be things happening other than the public  
11 notices that we get notice of. Is there any way we can  
12 be informed as to everything that happens  
13 environmentally that's going to affect us?

14 MS. DOCTORS: Mr. Williams has a public  
15 notice list and I believe the Illinois Pollution Control  
16 Board also has a list where they notify people of  
17 hearings if you tell them what you're interested in.

18 HEARING OFFICER WILLIAMS: All right. I  
19 can certainly put you down on our regular public notice  
20 list, so you will get notices of all hearings and the --

21 MR. FROST: -- You're already on my  
22 notification list.

23 HEARING OFFICER WILLIAMS: You're already  
24 on a notification list for this particular hearing  
25 because we knew that you were an interested person, but

1 I can put you down on the Agency notification list on a  
2 regular basis, so five years from now you can get  
3 notices of permit hearings, land -- air, land, water,  
4 this is -- this hearing today is an air hearing.

5 MS. ANDRIA: Right, I understand.

6 HEARING OFFICER WILLIAMS: So you would  
7 get land hearings, water hearings or even public water  
8 supply hearings if those are held.

9 MS. ANDRIA: I would appreciate being put  
10 on that list.

11 HEARING OFFICER WILLIAMS: All right,  
12 we'll put you on the list then.

13 MS. DOCTORS: But for the Board, you have  
14 to contact Illinois Pollution Control Board. That's a  
15 separate list.

16 MS. ANDRIA: Right.

17 HEARING OFFICER WILLIAMS: Right.  
18 Completely separate agency.

19 MS. ANDRIA: Now is there anything that  
20 -- any sort of heads up for citizens before it gets to  
21 the public notice stage?

22 MS. DOCTORS: Not unless there's outreach  
23 -- when there's, you know, some kind of general  
24 outreach, but not usually.

25 MS. ANDRIA: So, 'cause usually by the

1 time -- anything in my observation, the years that I've  
2 been looking into this, usually by the time it gets to  
3 the hearing stage, everything's set in concrete and  
4 citizens have little opportunity to affect the outcome.  
5 I mean, for instance, here, our last -- the public  
6 hearing that you had on the Granite City Steel  
7 expansion, I made what I thought was a very reasonable  
8 request for a monitor on top of a school that affected  
9 young children, yet there's been apparently no one's  
10 looked into that and the responsive comments I thought  
11 were -- really did not adequately reflect the depth of  
12 concern for the health of the community.

13 HEARING OFFICER WILLIAMS: All right. I  
14 think I can address this in a little way. I know that  
15 we have -- for each area we have -- we have Community  
16 Relations Officers. Mr. Frost happens to be the  
17 Community Relation Officer for air and we have them for  
18 land and for water and in -- suppose there's a landfill  
19 and I know this is completely separate from this present  
20 hearing, but I'm just trying to show you how it works.  
21 If you have a landfill, quite frequently the community  
22 coordinators will go down and if they know that there is  
23 a lot of complaints or lot of concern in the area,  
24 they'll go down and hold meetings in a particular area  
25 and talk with the citizens and get their concerns and

1 they also have -- before the hearing, they'll list those  
2 concerns so the Agency is aware of what they should be  
3 addressing at the hearing, so that's quite frequently.  
4 Now as far as air is concerned, I -- if we know you have  
5 concerns, then it's up to Community Relations perhaps to  
6 meet with the citizens prior to the hearing and to  
7 determine what their -- what their concerns are.

8 MS. ANDRIA: The citizens here, and there  
9 were several citizens who are here now and who were here  
10 earlier and some that couldn't come that were saved by  
11 virtue of the -- both the governor's repeal of the  
12 Retail Rate Law and our appeal of an incinerator and so,  
13 I mean, we managed to keep one of the heavy particulate  
14 emitters and a lot of other emissions emitters out by  
15 luck, but we want to be able to be at earlier in the  
16 process.

17 HEARING OFFICER WILLIAMS: Yes, ma'am.  
18 If you have concerns and things like that, you should  
19 perhaps contact your field office and I know if there  
20 are any very serious concerns, I'm sure -- I know the  
21 field office will pass them on to the appropriate  
22 bureau, but I do know that if there are something like  
23 -- if there's some permit hearing or -- for land,  
24 water, these quite frequently the Community Relations  
25 Officers do come out to the area, talk with the citizens

1     beforehand, determine all what their concerns are and,  
2     as I say, this is useful for us because we can then  
3     address the concerns at the hearing.

4                   MS. ANDRIA: Citizens can just call when  
5     they notice burning of like, for instance, the creosote  
6     poles that were burning in Madison?

7                   MR. BENBENEK: Yes.

8                   MS. ANDRIA: Then when they -- or when  
9     they go by and there's like a strong sense of naphthalene  
10    at Granite City Steel, they call and what happens?

11                  MR. BENBENEK: Well, depending on the  
12    gist of the complaint, we will investigate however we  
13    feel necessary. For the burning we will go out for that  
14    and, you know, as I said at the last hearing in December  
15    and when you asked the question about an odor, an odor  
16    doesn't necessarily mean there is a numerical violation  
17    of a limit, so -- but we take down -- each citizen that  
18    calls, we take down, register them as a complaint. We  
19    do not require anybody to come in in person or write.  
20    If they call in, that's adequate for us to register the  
21    complaint.

22                  MS. ANDRIA: Do you have -- are there  
23    such -- is there such a thing as a portable PM-10  
24    monitor?

25                  MR. SWINFORD: Not that's a reference or

1       equivalent monitor.

2                   MS. ANDRIA: I'm sorry, I didn't  
3       understand.

4                   MR. SWINFORD: Well, a reference or  
5       equivalent monitor are those that are established by  
6       U.S. Environmental Protection Agency that's data that  
7       can be considered interchangeable and can be compared to  
8       the air quality standards, so we would want to -- for a  
9       survey purpose, one might be able to use a portable  
10      monitor. I don't know if one exists, quite frankly, but  
11      you could not take the results of that and compare it to  
12      the air quality standard and have that information stand  
13      up. We would have to then go out with a reference or  
14      equivalent monitor to establish whether these values are  
15      in fact comparable to the air quality standards or not.

16                  MS. ANDRIA: So that if we noticed for a  
17      pattern of a certain company emitting what we can see as  
18      visible emissions, then we can't call and say hey, come  
19      measure?

20                  MR. SWINFORD: On a longer term basis,  
21      that would be something that usually gets worked through  
22      the regional office and they usually then determine if  
23      they perceive a problem sufficient to go in for a more  
24      permanent type of monitoring. Without a portable  
25      monitor to go out and just do a survey with, we would

1 probably not go in on a permanent basis until the  
2 regional office had had a chance to look into it and  
3 give us feedback that they think that is a possible  
4 violation or a possible air quality problem and then we  
5 would, you know, take that into consideration in  
6 designing our network and possibly putting in another  
7 site.

8 MS. ANDRIA: How does -- how does  
9 emissions that look very, very visibly dark that happen  
10 on -- after five o'clock on Friday over the weekends,  
11 how do they affect the monitoring results?

12 MR. KALEEL: Our monitoring is -- our  
13 monitors operate regardless of the day of the week.  
14 There, as Bob had mentioned, one of our monitors  
15 operates on a daily basis. That includes Saturday and  
16 Sunday and our other monitors are every six day, but  
17 that would also include Saturdays or Sundays whenever  
18 that is the sixth day in the schedule.

19 MS. ANDRIA: How often are they read and  
20 who reads them?

21 MR. KALEEL: The -- I probably should  
22 refer to Bob on that.

23 MR. SWINFORD: For one thing, the sample  
24 that's taken every sixth day is a twenty-four hour  
25 integrated sample, so we are monitoring for the complete

1 calendar day and since we're on every six day schedule,  
2 we do hit all the days of the week over time, so that if  
3 there is a weekend versus weekday problem, we'll be able  
4 to see that over time. The samples are manually  
5 collected. The sampler is visited obviously before the  
6 next six day schedule, some time between the two six day  
7 schedules and then the sample is taken off and then it's  
8 sent to a lab to be weighed and the mass on the filter  
9 then and the flow rate of the monitor then determines  
10 the mass loading, the micrograms per cubic meter of that  
11 particular sample.

12 MS. ANDRIA: How do you -- I mean and  
13 this is -- I'm a naive lay person -- how -- when you're  
14 measuring PM-10, what is it -- she said something --  
15 Penny said something about a plate, what exactly is it  
16 and what do you measure and what does it look like?

17 MR. SWINFORD: Okay. The PM-10 manual  
18 sampler is -- has a sampling head and then a blower  
19 motor that sucks air through a fiber -- or through a  
20 quartz fiber filter and the sampling head is designed in  
21 such a way that with an airflow of forty cubic feet per  
22 minute will pull the PM-10 particles through the filter  
23 and the particles that are larger than PM-10 don't make  
24 the bins, don't make the turns in the sampling head and  
25 therefore it's only the PM-10 part of the air stream

1 that actually is deposited on the filter. So it's  
2 basically the design of the sampler gives us a PM-10  
3 cut.

4 HEARING OFFICER WILLIAMS: Off the record  
5 a minute.

6 (Whereupon a discussion was held off the  
7 record, after which the following transpired.)

8 HEARING OFFICER WILLIAMS: Back on the  
9 record.

10 MS. ANDRIA: How does the humid air in  
11 the summer affect it and also how -- the PM-10 and how  
12 does the -- how do rainfall -- how does rainfall affect  
13 it?

14 MR. SWINFORD: In general it doesn't  
15 affect it because the flow rate is maintained constant  
16 by the monitor itself, so loading doesn't affect it. If  
17 we get a lot of heavy loading, in the old samplers it  
18 would make changes in the flow rate as the readings got  
19 higher and higher, but these particular samplers have  
20 equipment that keep the flow rate constant throughout  
21 the twenty-four hour time period that it's sampled, so  
22 if there is a lot of humidity that might tend to deposit  
23 on the filter, that doesn't affect the sampling. As far  
24 as the weighing, the filters are equilibrated to fifty  
25 percent humidity, I believe, both before on the initial

1 weight and afterwards when they do the final weighing,  
2 so basically it takes it back to a similar set of  
3 conditions so that water does not either -- is not  
4 interpreted as particulate or a certain amount of  
5 dryness does not underpredict what was actually weighed,  
6 so we equilibrate the filters both before and after to  
7 maintain a constant set of conditions for the weighing  
8 process.

9 MS. ANDRIA: Then is it by volume, by  
10 weight when you were talking about the --

11 MR. SWINFORD: The mass is determined by  
12 weight. It's just a difference in weight of this  
13 particular filter before and after it was sampled. The  
14 volume is determined by flow rate measurement that's  
15 taken when the sample is first put on and then when the  
16 sample is removed and then that flow rate is corrected  
17 to standard conditions and everything is referenced then  
18 to standard conditions based on that.

19 MS. ANDRIA: You said that the wind is  
20 generally from the southwest. Where is the nearest --  
21 all of the sites are located south or east of the coke  
22 by-products plant and partly of the Granite City -- the  
23 blast -- the boiler operation. Where are the nearest  
24 ones to the northeast, the nearest PM-10 monitors?

25 MR. SWINFORD: To the northeast? I

1 believe the -- the next --

2 MS. ANDRIA: -- Outside the Granite City  
3 area.

4 MR. SWINFORD: Outside the Granite City  
5 area particularly, we have monitors in Wood River, in  
6 Alton and in East St. Louis, so we do have monitors on  
7 either side of Granite City. Admittedly those are not  
8 that close that would really measure a significant  
9 impact from Granite City directly emissions. I would  
10 point out that the one monitor on Nameoki is the closest  
11 one to the coking facility and would be downwind of that  
12 under a number of normal conditions during the year.

13 MS. ANDRIA: But it would still be -- I  
14 mean, when you say the wind is from the southwest,  
15 doesn't that mean that it comes from the southwest --

16 MR. SWINFORD: -- Right.

17 MS. ANDRIA: -- and goes --

18 MR. SWINFORD: -- I think my point  
19 earlier was it's generally from southeast to southwest,  
20 so we are measuring a large percentage of winds also  
21 from the dead south which would be like a hundred and  
22 eighty degrees and then on either side of that  
23 direction, so with that monitor being essentially north  
24 of the coking plant, we would be fairly frequently  
25 downwind of that facility at that particular site.

1 MS. ANDRIA: The 24th is north -- 24th  
2 and Nameoki is north of --  
3 MR. BIENIECKI: Can we have the --  
4 MR. SWINFORD: -- You got that map  
5 again? I think it's pretty much north.  
6 MR. BENBENEK: Yes.  
7 MR. SWINFORD: In fact, that site -- the  
8 reason that site is on that side of town was essentially  
9 for measuring the impact of the coking facility.  
10 MS. ANDRIA: It's pretty much --  
11 MR. SWINFORD: -- It's north.  
12 MS. ANDRIA: It's not very much north.  
13 It's almost due west.  
14 MR. BIENIECKI: It looks due north.  
15 MR. SWINFORD: Yeah.  
16 MR. BENBENEK: The coking operations are  
17 right here.  
18 MR. BIENIECKI: Yeah, right at the end of  
19 Nameoki Road is the facility.  
20 MR. BENBENEK: This is Nameoki here which  
21 is due north.  
22 MS. ANDRIA: Okay, 'cause I consider the  
23 whole operation and Nameoki Road runs perpendicular into  
24 the coking operation.  
25 MR. SWINFORD: Right.

1 MS. ANDRIA: And there are piles of --  
2 that are -- there's a lot of activity there, there are a  
3 lot of trucks coming with stuff not covered that operate  
4 north of that, so that's why I'm saying that I -- I  
5 don't think there is anything that's reflecting the wind  
6 for the people -- I mean, I'm from Granite City and I am  
7 concerned about them, but I'm also concerned about  
8 what's going beyond if there are no PM-10 monitors. If  
9 anybody else has any questions, go ahead.

10 HEARING OFFICER WILLIAMS: Anybody else  
11 got any questions?

12 MR. ARNOLD: Go ahead.

13 MR. BIENIECKI: I was going to ask Jeff  
14 what his area of responsibility is. Does it cover the  
15 entire county?

16 MR. BENBENEK: Yes.

17 MR. BIENIECKI: How many sources do you  
18 think -- you know how many sources there are?

19 MR. BENBENEK: Industrial facilities?

20 MR. BIENIECKI: Not facilities. The  
21 emission sources.

22 MR. BENBENEK: Well, I think in our list  
23 -- you mean for county wide?

24 MR. BIENIECKI: Pardon?

25 MR. BENBENEK: County wide?

1 MR. BIENIECKI: County wide, uh-huh.

2 MR. BENBENEK: County wide, I do not have  
3 -- I'm sure it's up in the thousands county wide. If  
4 you're talking about permitted emitting emission units.

5 MR. BIENIECKI: You have to see each one  
6 of those sources during the year?

7 MR. BENBENEK: No, because we -- our --  
8 what we do routinely on an annual basis is it's based on  
9 a work plan that's approved by the USEPA and there are  
10 certain categories in that work plan that facilities  
11 have to fit into before we are required to make a --  
12 what we would call routine annual inspection at, so, no,  
13 we don't go to every permitted plant in the county or in  
14 any other part of the state. If they happen to fall  
15 into a category that's included in some work plan in the  
16 future, then we will go to them or if there's a special  
17 project that's required by our management or if we get  
18 complaints or if we notice a particular problem at a  
19 facility, then we don't -- you know, we can go in and  
20 make an inspection, but on a routine basis we won't go  
21 to all of them. For example, in the Madison County  
22 area, I have about fifty facilities that are considered  
23 to be what we would call a major facility.

24 MR. BIENIECKI: And that requires what  
25 kind of inspection schedule?

1 MR. BENBENEK: Well, the inspection  
2 schedule is normally on a work plan facility is a once a  
3 year. Certain facilities because of their size or  
4 complexity we could make additional inspections at and  
5 -- but we are not -- you know, we are not tied down to  
6 just saying well, once is enough. If we think we need  
7 to go more times, we will and that can change on a  
8 day-to-day, week-to-week, month-to-month basis.

9 MR. BIENIECKI: Are the companies subject  
10 to these inspections notified beforehand?

11 MR. BENBENEK: Not at all times. I would  
12 say most of the time we do notify because that's our  
13 standard -- our standard procedure, but if the situation  
14 calls for an unannounced inspection, we will do it.

15 MR. BIENIECKI: You have any difficulties  
16 with access?

17 MR. BENBENEK: No. None.

18 MS. ANDRIA: How many people do you think  
19 it would take to do your job to adequately inspect them  
20 all?

21 MR. BENBENEK: Well, I mean, I've been  
22 the engineer for Madison County for a number of years  
23 now and I think for most of those years I've been able  
24 to complete my work plan, so I guess on that basis, it's  
25 adequate, you know, it's adequate to have one person,

1 but we also have additional people in our office, as  
2 well, that assist me in the Madison County area, so, I  
3 mean, I think everybody thinks they need more help.

4 MR. BIENIECKI: Do you think there's any  
5 credence to the common viewpoint in Granite City among  
6 residents that on weekends when there's less  
7 supervision, for example, in the coke ovens that the  
8 employees aren't all that diligent in promptly replacing  
9 covers and things of that sort? Maybe I'm out of date,  
10 but I know that people feel that things really go to  
11 hell on weekends.

12 MR. BENBENEK: A couple years ago the  
13 USEPA adopted a national emission standard for air  
14 pollutants under Part 63 of the Federal Regulations.  
15 That required that they hire an observer to do topside  
16 and door inspections of the coke oven batteries on a  
17 daily basis.

18 MS. ANDRIA: What does that mean?

19 MR. MOORE: Everyday.

20 MR. BENBENEK: Everyday.

21 MS. ANDRIA: Who hires them?

22 MR. BENBENEK: At the time, since the --  
23 at the time of the rules being adopted, the company was  
24 required by the USEPA to hire a representative from a  
25 firm to do the inspections or hire a firm to do the

1 inspections.

2 MR. BIENIECKI: Is that the case in  
3 Granite City?

4 MR. BENBENEK: Yes. And those inspectors  
5 had to meet and be certified under USEPA guidelines to  
6 do those types of inspections.

7 MS. ANDRIA: To whom do they report their  
8 results?

9 MR. BENBENEK: They report the results to  
10 -- at this point in time since the Agency now has  
11 delegation of authority, I believe for those regulations  
12 those reports are coming directly to us. Originally  
13 they went to the USEPA and we were copied because, as I  
14 said, at that time we didn't have delegation.

15 MS. ANDRIA: How often do they report?

16 MR. BENBENEK: A month. Every month.  
17 They report on their daily observations.

18 MS. ANDRIA: And are those inspection  
19 reports available to the public?

20 MR. BENBENEK: The actual -- well, what  
21 we get is a summary and I believe that -- right now  
22 that's all they're required to report on a monthly  
23 basis.

24 MS. ANDRIA: But they are paid by the  
25 companies?

1 MR. BENBENEK: Yes, at this point in time  
2 it's a -- the company pays the contractor to do the work  
3 for them.

4 MS. ANDRIA: Do you know if they're an  
5 employee of the company or employees of a contractor?

6 MR. BENBENEK: They're employees of a  
7 contractor.

8 MR. BIENIECKI: Then is it your judgment  
9 that this common viewpoint of residents of Granite City  
10 is unsupported?

11 MR. BENBENEK: I would like for them --  
12 if they have any knowledge of anything that's happening  
13 that's untoward, I would appreciate a call.

14 MR. ARNOLD: Arnold again. This brings  
15 up the question of the exceedances in the vicinity of  
16 the Chemetco plant. Have those exceedances continued  
17 ever since the plant began, do you know?

18 MR. SWINFORD: I believe during each year  
19 since they've done monitoring there have been violations  
20 of the lead standard. I do not believe they have been  
21 every quarter, but I do believe that during a calendar  
22 year there have been at least one quarter of lead  
23 violations at that network that they are operating.

24 MR. ARNOLD: And have they made  
25 improvements in their control equipment?

1 MR. SWINFORD: I don't know that. I'm  
2 not that part of the --

3 MR. ARNOLD: How does a citizen manage to  
4 stop that kind of exceedances? How does EPA stop that  
5 kind of exceedances? How does it go on and on?

6 MR. KALEEL: Well, we have been involved  
7 and I don't know the specifics of it because I  
8 personally am not involved, but I know there have been  
9 both state and federal enforcement actions involving  
10 Chemetco and there are ongoing negotiations to develop  
11 plans for improving the operation of that facility.

12 MS. ANDRIA: How long has that been going  
13 on?

14 MR. KALEEL: I don't know if John or Jeff  
15 have any more --

16 MR. BENBENEK: First consent order we had  
17 with Chemetco was in 1983.

18 MR. ARNOLD: So exceedances have been  
19 going on a long time obviously?

20 MR. BENBENEK: We've had a number --  
21 we've had the most recent order that was signed was in  
22 1993.

23 MR. ARNOLD: And still we have  
24 exceedances on the record?

25 MR. BENBENEK: At this point, yes. The

1 company is installing additional control equipment right  
2 now, but the first set of these additional secondary  
3 units is not in operation as of yet, but they do have  
4 plans to install them on all the -- as secondary or I  
5 should say as tertiary controls on all the stacks.

6 MR. ARNOLD: Do you recognize that  
7 there's some inconsistency in having exceedances across  
8 the line and then request for non -- request for  
9 attainment status on this side of the line while we have  
10 continuing questions about health effects of PM-10, do  
11 you find inconsistency there?

12 MR. KALEEL: I guess I don't see an  
13 inconsistency where -- you know, the Chemetco facility,  
14 it's a very localized problem and we're talking about a  
15 different pollutant. We're talking about lead  
16 concentrations there and I understand lead is partially  
17 particulate, but -- or it is a particulate, but we have  
18 a completely different standard for lead separate from  
19 particulate matter. What we're talking about today is  
20 particulate matter in Granite City.

21 MR. ARNOLD: Well, if I try to put it in  
22 the form of a question, you recognize that the wind  
23 blows in all directions and sometimes blows pretty hard  
24 and that air pollution can cross the line so fast?

25 MR. KALEEL: I understand.

1 HEARING OFFICER WILLIAMS: Any more  
2 questions? Any more comments? Now's your chance.  
3 Well, actually now is not your chance. We're going to  
4 give you another chance. That sounds strange, but on  
5 the table here you'll find comment forms, so if anybody  
6 wishes to make comments, you may send them in to me,  
7 mail them in to me and we have extended the date of the  
8 hearing record to remain open until June the 5th, 1996,  
9 and all that remains for me now is to thank everybody  
10 for coming here and for your questions and concerns and  
11 on behalf of the Director, our Director Mary Gade and  
12 Bureau of Air staff and myself, thank you for coming.  
13 Hearing is now closed.
